*Autonomic Dysfunction After Spinal Cord Injury* Feb 22 2022 Autonomic dysfunction is a major and poorly understood consequence of spinal cord injury. It is a cause of very serious disability and requires much more research. It should be a focus of treatment strategies. This book will be of interest to anyone involved in research and treatment of spinal cord injury since it helps to explain the tremendously negative impact on the body caused by cord injury that is not as obvious as paralysis and loss of sensation. It contains a compilation of what is known about bladder, cardiovascular, bowel and sexual dysfunction after spinal cord injury, as it relates to the changes within the autonomic nervous system control of these functions. The book begins with a description of the time course of

autonomic dysfunctions and their ramifications from the first hours after a spinal cord injury to the more stable chronic states. The next section contains three chapters that address anatomical findings that may provide some of the foundation for autonomic dysfunctions in many of the systems. The system-specific chapters then follow in four sections. Each section begins with a chapter or two defining the clinical problems experienced by people with cord injury. The following chapters present research, basic and clinical, that address the autonomic dysfunctions.

Chemical Education: Towards Research-based Practice Jul 06 2020 Chemical education is essential to everybody because it deals with ideas that play major roles in personal, social, and economic decisions. This book is based on three principles: that all aspects of chemical education should be associated with research; that the development of opportunities for chemical education should be both a continuous process and be linked to research; and that the professional development of all those associated with chemical education should make extensive and diverse use of that research. It is intended for: pre-service and practising chemistry teachers and lecturers; chemistry teacher educators; chemical education researchers; the designers and managers of formal chemical curricula; informal chemical educators; authors of textbooks and curriculum support materials; practising chemists and chemical technologists. It addresses: the relation between chemistry and chemical education; curricula for chemical education; teaching and learning about chemical compounds and chemical change; the development of teachers; the development of chemical education as a field of enquiry. This is mainly done in respect of the full range of formal education contexts (schools, universities, vocational colleges) but also in respect of informal education contexts (books, science centres and museums).

Consumer Preferences and Acceptance of Food Products Jun 16 2021 The acceptance and preference of the sensory properties of foods are among the most important criteria determining food choice. Sensory perception and our response to food products, and finally food choice itself, are affected by a myriad of intrinsic and extrinsic factors. The pressing question is, how do these factors specifically affect our acceptance and preference for foods, both in and of themselves, and in combination in various contexts, both fundamental and applied? In addition, which factors overall play the largest role in how we perceive and behave towards food in daily life? Finally, how can these factors be utilized to affect our preferences and final acceptance of real food and food products from industrial production and beyond for healthier eating? A closer look at trends in research showcasing the influence that these factors and our senses have on our perception and affective response to food products and our food choices is timely. Thus, in this Special Issue collection "Consumer Preferences and Acceptance of Food Products", we bring together articles which encompass the wide scope of multidisciplinary research in the space related to the determination of key factors involved linked to fundamental interactions, cross-modal effects in different contexts and eating scenarios, as well as studies that utilize unique study design approaches and

methodologies.

**Questionnaire Design, Interviewing and Attitude Measurement** Sep 19 2021 This second edition of Dr Bram Oppenheim's established work, like the first, is a practical teaching text of survey methods. The new edition has extended its scope to include interviewing (both clip-board and depth interviewing), sampling and research design, data analysis, and a special chapter on pilot work. As before, the chapters on questionnaire design are supported by further chapters on attitude scaling methods, and on projective techniques. There is refreshingly critical treatment of problems such as faulty research designs, errors in sampling, ambiguities in question wording, biases in interviewing, losses of information, and the interpretation of attitude scales and of projective data. The book is laced throughout with instructive examples from many fields, ranging from marketing surveys to the study of children's political perceptions. Problems of reliability and validity are kept to the fore. Above all, the need for pilot work is emphasized at every stage. The book is intended for graduate methodology courses in the social sciences, but it is also designed to reach other professionals, including teachers, social workers, medical researchers, and opinion pollsters, who have to evaluate or carry out social surveys.

*Neuropsychology* Jan 12 2021 As the Handbook of Behavioral Neurobiology moves into a second volume, it is appropriate to take into general account the scope and content of this series. In its broadest sense, behavioral neurobiology is the study of the behaviors of animal organisms with reference to their neurological bases. The overall objective of this handbook series is to assemble, in ten volumes, a comprehensive and up-to-date treatment of the major areas that comprise behavioral neurobiology. Within such a framework, it is possible to provide the fundamental concepts, methods, and substantive advancements in these fields in a manner that will be useful to and that will also serve as a reference source for researchers educational programs who desire a well-balanced overview of the component areas of neurobiology. The intent in each volume has been to bring together a spectrum of approaches and disciplines that focuses upon the topic at hand. The first volume presented and discussed the problems of sensory integration; the present work is concerned with the neurobiology of cognitive processes; and forthcoming volumes will include the topics of motor coordination, learning and memory, biological rhythms, motivation, sexual behavior, social behavior and communication, and the evolution of nervous systems and behavior. Thus the purpose of the editors in planning this series has been to offer a distinct handbook, employing the many varied and prevailing avenues of attack upon current problems in behavior and neurological processes, that should prove of unique value and usefulness to professionals and students alike.
