Parallel Computing is Everywhere Oct 02 2022 The most powerful computers work by harnessing the combined computational power of millions of processors, and exploiting the full potential of such large-scale systems is something which becomes more difficult with each succeeding generation of parallel computers. Alternative architectures and computer paradigms are increasingly being investigated in an attempt to address these difficulties. Added to this, the pervasive presence of heterogeneous and parallel devices in consumer products such as mobile phones, tablets, personal computers and servers also demands efficient programming environments and applications aimed at small-scale parallel systems as opposed to large-scale supercomputers. This book presents a selection of papers presented at the conference: Parallel Computing (ParCo2017), held in Bologna, Italy, on 12 to 15 September 2017. The conference included contributions about alternative approaches to achieving High Performance Computing (HPC) to potentially surpass exa- and zetascale performances, as well as papers on the application of quantum computers and FPGA processors. These developments are aimed at making available systems better capable of solving intensive computational scientific/engineering problems such as climate models, security applications and classic NP-problems, some of which cannot currently be managed by even the most powerful supercomputers available. New areas of application, such as robotics, AI and learning systems, data science, the Internet of Things (IoT), and in-car systems and autonomous vehicles were also covered. As always, ParCo2017 attracted a large number of notable contributions covering present and future developments in parallel computing, and the book will be of interest to all those working in the field.

Grid Resource Management Jan 31 2020 In a dynamic computing environment, such as the Grid, resource management plays a crucial role for making distributed resources available on-demand to anyone from anywhere at any time without undermining the resource autonomy; this becomes an art when dealing with heterogeneous resources distributed under multiple trust domains spanning across the Internet. Today Grid execution environments

provide abstract workflow descriptions that need a dynamic mapping to actual deployments; this further accentuates the importance of resource management in the Grid. This monograph renders boundaries of the Grid resource management, identifies research challenges and proposes new solutions with innovative techniques for on-demand provisioning, automatic deployments, dynamic synthesis, negotiation-based advance reservation and capacity planning of Grid resources. The Grid capacity planning is performed with multi-constrained optimized resource allocations by modelling resource allocation as an on-line strip packing problem and introducing a new solution that optimizes resource utilization and QoS while generating contention-free solutions. On-demand resource provisioning becomes possible by simplifying abstract resource descriptions independent from the concrete installations. The book further explains the use of the semantic web technologies in the Grid to specify explicit definitions and unambiguous machine interpretable resource descriptions for intelligent resource matching and synthesis; the synthesis process generates new compound resources with aggregated capabilities and prowess. The newly introduced techniques haven been developed and integrated in ASKALON Grid application development and runtime environment, deployed in the Austrian Grid, and demonstrated through well performed experiments.

Relationship U-Turn: Approaches to Increase the Value of an Unprofitable Customer Jul 27 2019 Customer relationship management concentrates to a great extent on the profitable customers and how to enhance their profitability. Little insight has been given on how to treat the "wrong" customer. This literature research paper shows that customer profitability and overall firm profitability can be improved when dealing with unprofitable customers. The managerial approaches discussed focus on maintaining the customer relationship. For this reason, this paper differs from the general widespread strategy of termination or "firing" an invaluable customer. First, relationship marketing and "Relationship U-turn" are introduced in this paper. Second, customer value and methods of measuring customer value are discussed. The body of this paper concentrates on different approaches that try to turn unprofitable customer relationships into profitable ones. Some of the approaches focus on letting the customer take over more of the value chain activities such as self-service. Other approaches look more at the non-monetary value a customer can provide such as positive word-of-mouth. Examples from business-to-business (B2B) and business-to-consumer (B2C) markets are given for each approach and discussed in detail. The paper concludes with ideas for future research and a discussion. It emphasizes that companies need to realize that every customer is an asset that

contributes to the value of a firm. However, customers differ in their needs and a company has to tailor its offering to meet these needs. Only when a company takes a more customer-centric view can it be successful, especially in mature markets.

Theoretical Perspectives for Direct Social Work Practice Nov 10 2020 Praise for the first edition "Finally, a social work practice text that makes a difference! This is the book that you have wished for but could never find. Although similar to texts that cover a range of practice theories and approaches to clinical practice, this book clearly has a social work frame of reference and a social work identity." --Gayla Rogers, Dean of the Faculty of Social Work, University of Calgary The major focus of this second edition is the same; to provide an overview of theories, models, and therapies for direct social work practice, including systems theory, attachment theory, cognitive-behavioral theory, narrative therapy, solution-focused therapy, the crisis intervention model, and many more. However, this popular textbook goes beyond a mere survey of such theories. It also provides a framework for integrating the use of each theory with central social work principles and values, as well as with the artistic elements of practice. This second edition has been fully updated and revised to include: A new chapter on Relational Theory, and newly-rewritten chapters by new authors on Cognitive-Behavioral Theory, Existential Theory, and Wraparound Services New critique of the Empirically Supported Treatment (EST) movement Updated information on the movement toward eclecticism in counseling and psychotherapy A refined conceptualization of the editors' generalist-eclectic approach

Big Capital in an Unequal World Nov 30 2019 Following the hidden lives of the global "1%", this book examines the networks, social practices, marriages, and machinations of the elite in Pakistan. In doing so, it reveals the daily, even mundane, ways in which elites contribute to and shape the inequality that characterizes the modern world. Operating in a rapidly developing economic environment, the experience of Pakistan's wealthiest and most powerful members contradicts widely held assumptions that economic growth is leading to increasingly impersonalized and globally standardized economic and political structures.

Location and Context Awareness Jul 07 2020 These proceedings contain the papers presented at the 4th International Symposium on Location and Context Awareness (LoCA) during May 7-8, 2009 in

Tokyo, Japan. Location and context awareness are fundamental to next-generation mobile and pervasive computing systems. Pervasive computing is a model of computing in which computation is everywhere and computer functions are integrated into everything. The ultimate aim is to make information, applications and services available anywhere and at anytime in the human environment in a manner appropriate to our current context. Once away from the desktop, we find ourselves in a wide variety of contexts and hence situations. For computing to be relevant and useful in these emerging situations we must rely on a range of contextual cues. Context includes physical, environmental, and computational data, whether sensed or inferred. In addition, context includes details of a user's activities, goals, abilities, preferences, and surroundings. With location and context awareness we can expect computers to deliver information, services, and entertainment in a way that maximizes convenience and minimizes intrusion.
