Accounting: Introduction to Financial Accounting 23 2019 This book contains the solutions to problems in the main Introduction to Financial Accounting Textbook. This text is intended for a first course in introductory financial accounting. It was updated to reflect current International Financial Reporting Standards (IFRS). For example, it reflects the recent change in IAS38, para. 98, allowing the use of multiple methods in amortizing intangible assets. It focuses on core Introductory Financial Accounting topics that are a requisite requirements for students advancing to Intermediate Financial Accounting. Excluded are advanced topics that are covered in Intermediate Financial Accounting, such as leases and bond amortization. The text takes a corporate approach (vs. beginning with sole proprietorship emphasis and then converting to a corporate approach); this consistency throughout the book reduces the confusion of the introductory student.

Despite the publication of hundreds of textbooks in this field, each one intended to provide an improvement over previous textbooks, students of accounting continue to remain perplexed as a result of numerous subject areas that must be remembered and applied when solving problems. Various interpretations of accounting terms also contribute to the difficulties of mastering the subject. In a study of accounting, REA found the following basic reasons underlying the inherent difficulties of accounting: No systematic analysis were ever developed to follow in a step-by-step manner to solve typically encountered problems. This results from many different conditions and principles involved in a problem that leads to many possible different solution methods. To prescribe rules for each of the possible variations would involve an enormous number of additional steps, making this task more burdensome than solving the problem directly due to the expectation of much trial and error. Current textbooks normally explain a given principle in a few pages written by an accounting professional who has insight into the subject matter not shared by others. These explanations are often written in an abstract manner that causes confusion as to the principle's use and application. Explanations then are not sufficiently detailed or extensive enough to make the reader aware of the wide range of applications and different aspects of the principle being studied. The numerous possible variations of principles and their applications are usually not discussed, and it is left to the reader to discover this while doing exercises. Accordingly, the average student is expected to rediscover that which has already been established and practiced, but not always published or adequately explained. The examples typically following the explanation are too few in number and too simple to enable the student to obtain a thorough grasp of the involved principles. The explanations do not provide sufficient basis to solve problems that may be assigned for homework or given on examinations. Poorly solved examples, such as these can be presented in abbreviated form which leaves out much explanatory material between steps, and as a result, it leaves the reader to figure out the missing information. This leaves the reader with an impression that the problems and even the solutions are hard to learn - completely the opposite of what an example is supposed to do. Poor examples are often worded in a confusing way. They might not state the nature of the problem or they present a solution, which appears to have no direct relation to the problem. These problems usually offer an overly general discussion - never revealing how or what is to be solved. Many examples do not include accompanying diagrams or graphs denying the reader the exposure necessary for drawing good diagrams and graphs. Such problems

only strengthens understanding by simplifying and organizing accounting processes. Students can learn the subject only by doing exercises themselves and reviewing them in class, obtaining experience in applying the principles with their different ramifications. When doing the exercises by themselves, students find that they are required to devote considerable more time to accounting than to other subjects, because they are uncertain with regard to the selection and application of the theorems and principles involved. It is necessary for students to discover those "tricks" not revealed in their texts (or review books) that make it possible to solve problems easily. Students must usually resort to methods of trial and error to discover these "tricks," therefore finding out that they sometimes spend several hours to solve a single problem. When reviewing the exercises in classrooms, instructors usually require students to take turns in writing solutions on the boards and explaining them to the class. Students often find it difficult to do in a manner that holds the interest of the class, and enables the remaining students to follow the material written on the board. The remaining students in the class are thus too occupied with copying the material off the boards to follow the professor's explanations. This book is intended to aid students in accounting overcome the difficulties described by supplying detailed illustrations of solution methods that are usually not apparent to students. Solution methods are illustrated by problems that have been selected from those often assigned for class work and given on examinations. The problems are arranged in order of complexity to enable students to learn and understand a particular topic by reviewing the problems in sequence. The problems are illustrated with detailed, step-by-step explanations, to save the students large amounts of time that is often needed to fill in the gaps that are usually found between the illustrations in textbooks or review/outline books. The staff of REA considers accounting a subject that is best learned by all students to view the methods of analysis and solution techniques. This learning approach is similar to that practiced in various laboratories, particularly in the medical fields. In using this book, students may review and study the illustrated problems at their own pace; students are not limited to the time such problems receive in the classroom. When students want to look up a particular problem and solution, they can readily locate it in the book by referring to the index that has been extensively prepared. It is also possible to locate a particular type of problem by glancing at just the material within the boxed portions. Each problem is neatly surrounded by a heavy black border for speedy identification.
