Achieving System Reliability Growth Through Robust Design and Test Feb 08 2021 Historically, the reliability growth process has been thought of, and treated as, a reactive approach to growing reliability based on failures "discovered" during testing or, most unfortunately, once a system/product has been delivered to a customer. As a result, many reliability growth models are predicated on starting the reliability growth process at test time "zero", with some initial level of reliability (usually in the context of a time-based measure such as Mean Time Between Failure (MTBF)). Time "zero" represents the start of testing, and the initial reliability of the test item is based on its inherent design. The problem with this approach, still predominant today, is that it ignores opportunities to grow reliability during the design of a system or product, i.e., opportunities to go into reliability growth testing with a higher initial inherent reliability at time zero. In addition to the traditional approaches to reliability growth during test, this book explores the activities and opportunities that can be leveraged to promote and achieve reliability growth during the design phase of the overall system life cycle. The ability to do so as part of an integrated, proactive design environment has significant implications for developing and delivering reliable items quickly, on time and within budget. This book offers new definitions of how failures can be characterized, and how those new definitions can be used to develop metrics that will quantify how effective a Design for Reliability (DFR) process is in (1) identifying failure modes and (2) mitigating their root failure causes. Reliability growth can only occur in the presence of both elements.

How Growth Really Happens May 26 2022 Achieving economic growth is one of today's key challenges. In this groundbreaking book, Michael Best argues that to understand how successful growth happens we need an economic framework that focuses on production, governance, and skills. This production-centric framework is the culmination of three simultaneous journeys. The first has been Best's visits to hundreds of factories worldwide, starting early as the son of a labor organizer and continuing through his work as an academic and industrial consultant. The second is a survey of two hundred years of economic thought from Babbage to Krugman, with stops along the way for Marx, Marshall, Young, Penrose, Richardson, Schumpeter, Kuznets, Abramovitz, Keynes, and Jacobs. The third is a tour of historical episodes of successful and failed transformations, focusing sharply on three core elements -- the production system, business organisation, and skill formation -- and their interconnections. Best makes the case that government should create the institutional infrastructures needed to support these elements and their interconnections rather than subsidise individual enterprises.

Frontiers of Sulfur Metabolism in Plant Growth, Development, and Stress Response Jul 16 2021 Growing plants have a constitutive demand for sulfur to synthesize proteins, sulfolipids and other essential sulfur containing molecules for growth and development. The uptake and subsequent distribution of sulfate is regulated in response to demand and environmental cues. The importance of sulfate for plant growth and vigor and hence crop yield and nutritional quality for human and animal diets has been clearly recognized. The acquisition of sulfur by plants, however, has become an increasingly important concern for the agriculture due to the decreasing S-emissions from industrial sources and the consequent limitation of inputs from atmospheric deposition. Molecular characterization involving transcriptomics, proteomics and metabolomics in *Arabidopsis thaliana* as well as in major crops revealed that sulfate uptake, distribution and assimilation are finely regulated depending on sulfur status and demand, and that these regulatory networks are integrated with cell cycle, photosynthesis, carbohydrate metabolism, hormonal signaling, uptake and assimilation of other nutrients, etc., to enable plant growth, development, and reproduction even under different biotic and abiotic stresses. This knowledge can be used to underpin approaches to enhance plant growth and nutritional quality of major food crops around the world. Although considerable progress has been made regarding the central role of sulfur metabolism in plant growth, development and stress response, several frontiers need to be explored to reveal the mechanisms of the cross-talk between sulfur metabolism and these processes. In this research topic the knowledge on plant sulfur metabolism is reviewed and updated. Focus is put not only on molecular mechanisms of control of sulfur metabolism but also on its integration with other vital metabolic events. The topic covers 4 major areas of sulfur research: sulfate uptake, assimilation and metabolism, regulation, and role in stress response. We hope that the topic will promote interaction between researchers with different expertise and thus contribute to a more integrative approach to study sulfur metabolism in plants.

Low-carbon Growth Links with China Sep 17 2021 China is the fastest growing economy in the world and by 2030 could account for half of the world's CO2 emissions. It has recently set out ambitious plans to reduce the carbon intensity of its economy, boost green energy, draft a new climate law and introduce carbon trading. MPs say that this is the ideal time for the UK to work together with China; both to prepare the ground for a future international agreement and to secure potential opportunities for British businesses in China's burgeoning markets for low-carbon technologies (currently worth around £430 billion). The report warns, however, that the Government's work in China suffers from a lack of strategic direction. There are too many small projects, focused on too many different areas, rather than a coordinated effort to achieve key objectives tailored to appeal to Chinese priorities and which build on UK strengths. For policy, this means a focus on carbon pricing and accounting, where the UK has experience to offer. In the business area this means identifying the potential markets and technologies in which the UK could have a comparative advantage. One area in which the UK could establish a comparative advantage with the right Government support is carbon, capture and storage (CCS) technology which could be a substantial export earner if the UK is able to develop CCS expertise early. The UK's ability to influence policy in China and to compete for business in low-carbon development depends on the reputation of the UK as a credible leader
