**Manual of INTERNAL FIXATION** Apr 30 2020 In the early 1950s, the pioneering work of Robert Danis on operative treatment of fractures was in danger of falling into oblivion. Maurice E. Muller, impressed and intrigued by his contacts with Danis, first critically applied internal fixation and immediate mobilization to some 80 patients and found the basic concept confirmed, but in need of further development with regard to technology, clinical application, and scientific analysis. In 1958 he assembled a group of friends, general and orthopedic surgeons, willing to invest time and effort in helping to create the necessary armamentarium and to form a study group for clinical trials. This group was set up in the same year under the name *Arbeitsgemeinschaft für Osteosynthesefragen (AO)*, later on to be known in English-speaking countries as the *Association for the Study of Internal Fixation (ASIF)*. The first report on operative treatment of fractures by Muller, Allgower, and Willenegger, published in 1963, stressed the advantages of early open reduction and internal fixation. This book, first published in German, amusingly lost an important part when translated into English. At the suggestion of worried American and English participants, a picture series showing the healing pattern of 188 tibial fractures operated on in Chur between December 20, 1961 and April 26, 1962 was left out.

**LISP 1.5 Programmer's Manual** Jul 22 2019 The manual describes LISP, a formal mathematical language. LISP differs from most programming languages in three important ways.

The first way is in the nature of the data. The LISP language is designed primarily for symbolic data processing used for symbolic calculations in differential and integral calculus, electrical circuit theory, mathematical logic, game playing, and other fields of artificial intelligence. The manual describes LISP, a formal mathematical language. LISP differs from most programming languages in three important ways. The first way is in the nature of the data. In the LISP language, all data are in the form of symbolic expressions usually referred to as S-expressions, of indefinite length, and which have a branching tree-type of structure, so that significant subexpressions can be readily isolated. In the LISP system, the bulk of the available memory is used for storing S-expressions in the form of list structures. The second distinction is that the LISP language is the source language itself which specifies in what way the S-expressions are to be processed. Third, LISP can interpret and execute programs written in the form of S-expressions. Thus, like machine language, and unlike most other high level languages, it can be used to generate programs for further executions.
