Mechanical Engineering Education Handbook Mar 13 2021 "This book is believed to be the first to specifically address mechanical engineering education. It is divided into three sections : pedagogy, curriculum, and future. The pedagogy section contains seven chapters on various aspects of enhancing student learning. Chapter one concerns research regarding mechanical engineering (ME) students' learning preferences. ME students are much more visual and prefer more problem solving compared to the general population. Chapter two is on leveraging technology to elevate pedagogy. The authors show many different ways of using technologies, such as the use of iMovie and Doceri, to enhance the practice of teaching. Chapter three on mastery-based learning concerns assessing students on what skills they can do well rather than almost solely on how well they do on exams. Chapter four discusses how team-based assignments can be used to meet multiple student outcomes. Examples are given for a fluid mechanics lab and a thermodynamics class. Chapter five describes how team-based active learning can be used to expose students to the aerospace design process and industry practices. Chapter six shows how a problem-based learning approach was converted to an entrepreneurially minded learning approach in a mechatronics design course. The application of the Kern Entrepreneurial Engineering Network (KEEN) framework showed a significant increase in the students' entrepreneurial mindset. Chapter seven recommends the inclusion of open-ended problems in courses at all levels to help prepare students for real-world problems, which often have multiple possible correct solutions. Section two on curriculum has five chapters more specifically on ME courses and programs. Chapter eight advocates incorporating more hands-on design into the ME curriculum because of its importance in practice. Chapter nine shows an example of how an entrepreneurial mindset can be fostered and developed in an engineering experimentation course. Chapter ten demonstrates how research has shown that replacing thermodynamic tables, which students often struggle to use, with thermodynamic property charts can help students form better mental models. Chapter eleven discusses the use of active learning techniques to more effectively incorporate the teaching of materials in the ME curriculum. Chapter twelve considers how reverse engineering can be incorporated into the ME curriculum. While original design is incorporated into the ME curriculum, reverse engineering of existing designs can be a valuable addition that can help prepare MEs for professional practice. Section three has two chapters related to the future. Chapter thirteen discusses how ME students can be more effectively prepared for their future in the industry, not so much by changing the curriculum, but by changing the teaching approach. Some examples include less theory and more practice, improved problem solving and simulating the industrial work environment. The authors include those who work or have worked full time in industry and work part time or full time in academia, as well as two relatively recent ME graduates. The last chapter discusses possible future areas of research for improving mechanical engineering education. Those areas include, for example, improved course content, curriculum, communication, assessment, virtual reality, codes and standards, multimedia and innovation/entrepreneurship"--

Notes in Mechanical Engineering Aug 18 2021 Excerpt from Notes in Mechanical Engineering: Compiled Principally for the Use of Students Attending the Lectures in This Subject at the City of London College "The City and Guilds of London Institute for the Advancement of Technical Education" having, in the year 1880, issued a programme of instruction in various subjects, upon the basis of the system so well developed by the Government Department of Science and Art, the author became enrolled as a teacher of Mechanical Engineering in connection with the Institute, and delivered a series of lectures in that subject at the City of London College. His efforts to render the course attractive and useful were fairly successful, as he was able to draw upon a very large collection of diagrams prepared for machine construction and other allied science subjects; and these, supplying the ground work of the illustrations, enabled him to devote some time to the preparation of others specially applicable to the circumstances of the case. However, the very abundance of the information proved in itself a drawback, as the majority of the students, coming totally unprepared by previous training for taking notes, and having but little aptitude for dealing with formulæ, or even for the classification of facts, were unable to assimilate the technical food placed before them.
