GM 6.2 & 6.5 Liter Diesel Engines Mar 26 2020 Finally, a rebuild and performance guide for GM 6.2 and 6.5L diesel engines! In the late 1970s and early 1980s, there was considerable pressure on the Detroit automakers to increase the fuel efficiency for their automotive and light-truck lines. While efficient electronic engine controls and computer-controlled gas engine technology was still in the developmental stages, the efficiency of diesel engines was already well documented during this time period. As a result,

General Motors added diesel engine options to its car and truck lines in an attempt to combat high gas prices and increase fuel efficiency. The first mass-produced V-8 diesel engines of the era, the 5.7L variants, appeared in several General Motors passenger-car models beginning in 1978 and are often referred to as the Oldsmobile Diesels because of the number of Oldsmobile cars equipped with this option. This edition faded from popularity in the early 1980s as a result of falling gas prices and quality issues with diesel fuel suppliers, giving the cars a bad reputation for dependability and reliability. The 6.2L appeared in 1982 and the 6.5L in 1992, as the focus for diesel applications shifted from cars to light trucks. These engines served faithfully and remained in production until 2001, when the new Duramax design replaced it in all but a few military applications. While very durable and reliable, most of these engines have a lot of miles on them, and many are in need of a rebuild. This book will take you through the

entire rebuild process step by step from diagnosis to tear down, inspection to parts sourcing, machining, and finally reassembly. Also included is valuable troubleshooting information, detailed explanations of how systems work, and even a complete Stanadyne DB2 rebuild section to get the most out of your engine in the modern era. If you have a 6.2, or 6.5L GM diesel engine, this book is a must-have item for your shop or library.

Supporting Air and Space Expeditionary Forces
Jun 16 2019 RAND was asked by the U.S. Air Force to carry out analyses needed to determine

alternatives for the use of CONUS Centralized Intermediate Repair Facilities (CIRFs) that would provide increased maintenance efficiency (compared with traditional, decentralized structures) without reducing combat support capability. These CIRFs would provide off-equipment repair of propulsion and avionics components for the F-15, F-16, and A/OA-10. RAND developed an optimization-based analytic method for CIRF network design that identifies a range of cost-effective alternatives. Aircraft force structure bed-downs resulting from the 2005 Defense Base Closure and Realignment (BRAC) recommendations were used in the analyses, and all CONUS active duty bases and Air National Guard and Air Force Reserve Command installations were included, considering support to three tasking scenarios--normal peacetime training and readiness, Air and Space Expeditionary Force (AEF) deployment, and major regional conflicts (MRCs). General results from the analyses are:

CONUS CIRF is a cost-effective maintenance strategy for nearly all commodities analyzed; potential manpower cost savings more than offset increased transport costs; CONUS CIRF total pipeline requirements generally are not excessive; many network designs are virtually equivalent in cost and performance; and large user bases are naturally attractive CONUS CIRF locations. The monograph also provides commodity-specific results and recommendations.
