Fifty Challenging Problems in Probability with Solutions 2020 Can you solve the problem of "The Unfair Subway"? Marvin gets off work at random times between 3 and 5 p.m. His mother lives uptown, his girlfriend lives downtown. He takes the first subway that comes in either direction and eats dinner with the one he meets. His mother complains that he never comes to see her, but he says she has a 50-50 chance. He has seen her twice in the last 20 working days. Explain. Marvin's adventures in probability are one of the fifty interesting puzzles that illustrate both elementary and advanced aspects of probability, each problem designed to challenge the mathematically inclined. From "The Flippant Juror" and "The Prisoner's Dilemma" to "The Cliffhanger" and "The Clumsy Chemist," they provide an ideal supplement for all who enjoy the stimulating fun of mathematical problem solving. Professor Frederick Mosteller, who teaches statistics at Harvard University, has chosen the problems for their originality, general interest, or because they demonstrate valuable techniques. In addition, the problems are graded as to difficulty and many have considerable stature. Indeed, one has "enlivened the research lives of excellent mathematicians." Detailed solutions are included. There is every probability you'll need at least once in your life.

Anxiety in Schools 2022 Anxiety in Schools presents current theory and research addressing both general and content-specific contributions to anxieties experienced in schools. The concept of «academic anxiety» is a new construct, formed through the content within this book, and is proposed as a unifying representation of various forms of specialized manifestations of anxiety in school settings. With contributions from leading researchers in respective fields of academic anxieties, the book provides detailed and thorough explorations of the various specific orientations toward anxieties in school settings. Explicit attention is given to the broader context of academic anxiety and the contextual influences that can be brought to overcome or mitigate the impact of many academic anxieties encountered by learners.

Strategies and Solutions to Advanced Organic Reaction Mechanisms: A New Perspective on McKillop's Problems 2020 Strategies and Solutions to Advanced Organic Reaction Mechanisms: A New Perspective on McKillop's Problems builds upon Alexander (Sandy) McKillop's popular text, Solutions to McKillop's Advanced Problems in Organic Reaction Mechanisms, providing a unified methodological approach to dealing with problems of organic reaction mechanism. Inverse Problems and Nonlinear Evolution Equations 2021 This book is based on the method of operator identities and related theory of S-nodes, both developed by Lev Sakhnovich. The notion of the transfer function generated by the S-node plays an essential role. The authors present fundamental solutions of important systems of differential equations using the transfer matrix function, that is, either directly, the transfer matrix function or via the representation in this form of the corresponding Darboux matrix. Bäcklund–Darboux transformations and explicit solutions are considered. The transfer matrix function representation of the fundamental solution yields solution of an inverse problem, namely, the problem of recovering a system from its Weyl function. Weyl theories of selfadjoint and skew-selfadjoint Dirac systems, related systems, discrete Dirac systems, system auxiliary to the N-wave equation and a system rationally dependent on the spectral parameter are obtained in this way. The results on direct and inverse problems are applied to the study of the initial-boundary value problems for integrable (nonlinear) wave equations via inverse scattering transformation method. Evolution of the Weyl function and solution of the initial-boundary value problem on a semi-strip are derived for many important nonlinear equations. Some uniqueness and global existence theorems are also proved in detail using evolution formulas. The reading of the book requires only some basic knowledge of linear algebra, calculus and operator theory from the standard university courses.

Princeton Problems in Physics, with Solutions Oct 24 2021 Aimed at helping the physics student to develop a solid grasp of basic graduate-level material, this book presents worked solutions to a wide range of interesting problems. These problems have been culled from the preliminary and general examinations created by the physics department at Princeton University for its graduate program. The authors, all students who have successfully completed the examinations, selected these problems on the basis of usefulness, interest, and originality. They provided highly detailed solutions to each one. Their book will be a valuable resource not only to other graduate students but to college physics teachers as well. The first four chapters pose problems in the areas of mechanics and magnetism, quantum mechanics, and thermodynamics and statistical mechanics, thereby serving as a review of material typically covered in undergraduate courses. Later chapters deal with material new to most graduate students, challenging them on such topics as condensed matter, relativity and astrophysics, quantum physics, elementary particles, and atomic and general physics.

Almost Global Solutions of Capillary-Gravity Water Waves Equations on the Circle Apr 17 2021 The goal of this monograph is to prove that any solution of the Cauchy problem for the capillary-gravity water waves equations in one space dimension, with periodic, even in space, small and smooth enough initial data, is almost globally defined in time on Sobolev spaces, provided the gravity-capillarity parameters are taken outside an exceptional subset of zero measure. In contrast to the many results known for these equations on the real line, where the Cauchy data, one cannot make use of dispersive properties of the linear flow. Instead, a normal forms procedure is used, eliminating those contributions to the Sobolev energy that are of lower degree of regularity in the solution. Since the water waves equations form a quasi-linear system, the usual normal forms procedure would face the well-known problem of losses of derivatives in the unbounded transformations. To overcome this, after a parilinearization of the capillary-gravity water waves equations, we perform several paradifferential reductions to obtain a diagonal system with constant coefficient symbols, up to smoothing remainder terms.

start with a normal form procedure where the small divisors are compensated by the previous paradigm regularization. The reversible structure of the water waves equations, and the fact that we seek solution in a finite phase space, guarantees a key cancellation which prevents the growth of the Sobolev norms of the solution.

Climate Change Jul 21 2021 It is the greatest environmental challenge of the 21st Century. But what do we know about global climate change? And what can we do about it? Most of the world's top scientists agree: the emissions of carbon dioxide and other greenhouse gases from human activities such as industrial production, fossil fuel combustion, and land-use changes are causing the earth to get warmer. Impacts of this warming include sea-level rise, damage to our coastal areas, accelerated rates of species loss, altered agricultural patterns, and increased incidences of infectious diseases. The effects of climate change - and efforts to mitigate climate change - also have substantial economic ramifications. The book presents the latest research and analysis from leading scientists, economists, academics, and policy-makers, including: "Tom Wigley" and "Joel Smith," who, along with other authors of the Science and Impacts chapter, explain the basic science of climate change, the growing evidence that human activities are changing our climate, and the impacts of these changes; "Eileen Claessens," "John Gummer," "Henry Lee," and other authors of the Global Strategies chapter, who describe what nations can do to address the challenge of climate change.

or are not doing to address climate change, and the state of international climate talks; "Robert Stavins," "Weyant," "Ev Ehrlich," and other economists, who explain why economic analyses of climate policy are conducted, why the projected costs of addressing climate change vary so widely among economic models; how changes driven by today's economy can influence climate policy; "Gov. Jean Shaheen" and other actors in the Innovative Solutions chapter, who describe what state and local governments in the United States and multinational companies are doing to monitor and curb greenhouse gas emissions; and "Forest Reinhardt" offers business leaders advice on steering their companies on a path that is healthy for business as well as the global climate. This publication has also been published in paperback, please click here for details.
