Response to Marine Oil Pollution Sep 30 2022 **Response to Marine Oil Pollution - Review and Assessment** is the essential source book, now updated, for all involved in marine oil pollution consequences and response. It covers policy, planning and operations, and provides technical assessment of the true nature of the problem, of the means to maximise the performance of current techniques and equipment, and of the bases for future improvements. This book provides a fundamental understanding of the oil properties and processes which determine the persistence and impacts of oils in the marine environment. It establishes parameters against which to evaluate performance of all current techniques and equipment, and the environmental impacts of their use. It identifies design parameters, and makes proposals for the creation and development of more effective equipment and techniques. The book also shows how a fresh approach to cargo transfer, and the scaling of spillage response provision to oil releases on immediate impact, will be more effective overall, and will ensure that approved waste handling and disposal facilities are not

overwhelmed. The recent Sea Empress incident is reviewed to illustrate the points made and conclusions reached, and to emphasise the need for thorough salvage planning for all future incidents.

The Industrial Windmill in Britain Feb 09 2021 Windmills have been around in Britain for some eight hundred years, grinding wheat into flour and, in some places, pumping water off low-lying land. These aspects of their story have been ably covered by an extensive literature. Passing mention has been made of other uses of wind power, such as crushing oil seed, sawing timber and grinding snuff, but no detailed consideration has ever been given to these alternative applications of the windmill. This new, thoroughly researched book fills that gap. The author has identified more than twenty 'industrial' uses, from the extraction and processing of raw materials and the manufacture of commodities to land-based facilities for their transport, in a total of 262 windmills. There were more, to which references have been found, particularly in relation to mines and salterns, but specific examples are lacking. In the early 18th century most corn mills were post mills, little changed from the 12th century. By the start of the 19th century, however, the windmill was very different, with tall brick towers, iron gearing and self-regulating devices, and the author shows how the evolution of these improvements resulted from the diverse use of wind power by the industrialists of the day.
