*The Criminal Process* Apr 29 2022 In recent years the English criminal justice system has been shaken by certain notorious cases such as the Guildford Four, the Birmingham Six, and the Cardiff Three. The quashing of convictions in these and other cases has brought to public notice the structural deficiencies which exist in the criminal justice system. In this book Professor Ashworth addresses one of the most controversial areas of the entire criminal process: the pre-trial stage. Taking as his starting point the detention of suspects in police custody, the author examines six key issues in the pre-trial process: the questioning of suspects, cautioning of offenders, prosecutorial review, remand decisions, mode of trial decisions, and plea bargaining. Drawing upon empirical research, substantive law, and official guidance, the author considers how the rights of victims and defendants are promoted within the system, and in particular considers the potential impact of the European Convention of Human Rights on the administration of criminal justice in England and Wales. The recommendations of the 1993 Royal Commission on Criminal Justice are critically appraised.

**Laboratory Mathematics** Jun 19 2021 The best laboratory math text on the market for almost 20 years, this title covers both the general principles of mathematics and specific equations, formulas, and calculations used for laboratory testing. It provides simple, easily understood explanations of calculations commonly used in clinical and biological laboratories. Contains more than 1000 practice problems.

**Medical Statistics** Jan 27 2022 The 5th edition of this popular introduction to statistics for the medical and health sciences has undergone a significant revision, with several new chapters added and examples refreshed throughout the book. Yet it retains its central philosophy to explain medical statistics with as little technical

detail as possible, making it accessible to a wide audience. Helpful multi-choice exercises are included at the end of each chapter, with answers provided at the end of the book. Each analysis technique is carefully explained and the mathematics kept to minimum. Written in a style suitable for statisticians and clinicians alike, this edition features many real and original examples, taken from the authors' combined many years' experience of designing and analysing clinical trials and teaching statistics. Students of the health sciences, such as medicine, nursing, dentistry, physiotherapy, occupational therapy, and radiography should find the book useful, with examples relevant to their disciplines. The aim of training courses in medical statistics pertinent to these areas is not to turn the students into medical statisticians but rather to help them interpret the published scientific literature and appreciate how to design studies and analyse data arising from their own projects. However, the reader who is about to design their own study and collect, analyse and report on their own data will benefit from a clearly written book on the subject which provides practical guidance to such issues. The practical guidance provided by this book will be of use to professionals working in and/or managing clinical trials, in academic, public health, government and industry settings, particularly medical statisticians, clinicians, trial co-ordinators. Its practical approach will appeal to applied statisticians and biomedical researchers, in particular those in the biopharmaceutical industry, medical and public health organisations.
