Automotive Spark-Ignited Direct-Injection Gasoline Engines Feb 12 2021 The process of fuel injection, spray atomization and vaporization, charge cooling, mixture preparation and the control of in-cylinder air motion are all being actively researched and this work is reviewed in detail and analyzed. The new technologies such as high-pressure, common-rail, gasoline injection systems and swirl-atomizing gasoline fuel injections are discussed in detail, as these technologies, along with computer control capabilities, have enabled the current new examination of an old objective; the direct-injection, stratified-charge (DISC), gasoline engine. The prior work on DISC engines that is relevant to current GDI engine development is also reviewed and discussed. The fuel economy and emission data for actual engine configurations have been obtained and assembled for all of the available GDI literature, and are reviewed and discussed in detail. The types of GDI engines are arranged in four classifications of decreasing

complexity, and the advantages and disadvantages of each class are noted and explained. Emphasis is placed upon consensus trends and conclusions that are evident when taken as a whole; thus the GDI researcher is informed regarding the degree to which engine volumetric efficiency and compression ratio can be increased under optimized conditions, and as to the extent to which unburned hydrocarbon (UBHC), NO_x and particulate emissions can be minimized for specific combustion strategies. The critical area of GDI fuel injector deposits and the associated effect on spray geometry and engine performance degradation are reviewed, and important system guidelines for minimizing deposition rates and deposit effects are presented. The capabilities and limitations of emission control techniques and after treatment hardware are reviewed in depth, and a compilation and discussion of areas of consensus on attaining European, Japanese and North American emission standards presented. All known research, prototype and production GDI engines worldwide are reviewed as to performance, emissions and fuel economy advantages, and for areas requiring further development. The engine schematics, control diagrams and specifications are compiled, and the emission control strategies are illustrated and discussed. The influence of lean-NO_x catalysts on the development of late-injection, stratified-charge GDI engines is reviewed, and the relative merits of lean-burn, homogeneous, direct-injection engines as an option requiring less control complexity are analyzed.

Concepts in Turbocharging for Improved Efficiency and Emissions Reduction Oct 30 2019

Legislative requirements to reduce CO₂ emissions by 2020 have resulted in significant efforts by car manufacturers to explore various methods of pollution abatement. One of the most effective ways found so far is by shortening the cylinder stroke and downsizing the engine. This new engine then needs to be boosted, or turbocharged, to create the full and original load torque. Turbocharging has been and will continue to be a key component to the new technologies that will make a positive difference in the next-generation engines of years to come. Concepts in Turbocharging for Improved Efficiency and Emissions Reduction explores the many ways that turbocharging will deliver concrete results in meeting the new realities of sustainable, green transportation. This collection of very focused technical papers, selected by Mehrdad Zangeneh, PhD., a professor of thermo-fluids at University College in London, provides an assessment of several novel designs intended to improve fuel consumption and cap emissions, while maintaining torque at all speeds. The book is divided into four sections, each addressing the most cutting-edge technologies on the market today:

- o Two-Stage Turbocharging
- o Variable Geometry Compressors
- o Unconventional Compressor Configurations
- o Electrically Assisted Turbocharging

Reducing Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty

Vehicles, Phase Two Jun 18 2021 Medium- and heavy-duty trucks, motor coaches, and transit buses - collectively, "medium- and heavy-duty vehicles", or MHDVs - are used in every sector of the economy. The fuel consumption and greenhouse gas emissions of MHDVs have become a focus of legislative and regulatory action in the past few years. This study is a follow-on to the National Research Council's 2010 report, Technologies and Approaches to Reducing the Fuel Consumption of Medium-and Heavy-Duty Vehicles. That report provided a series of findings and recommendations on the development of regulations for reducing fuel consumption of MHDVs. On September 15, 2011, NHTSA and EPA finalized joint Phase I rules to establish a comprehensive Heavy-Duty National Program to reduce greenhouse gas emissions and fuel consumption for on-road medium- and heavy-duty vehicles. As NHTSA and EPA began working on a second round of standards, the National Academies issued another report, Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two: First Report, providing recommendations for the Phase II standards. This third and final report focuses on a possible third phase of regulations to be promulgated by these agencies in the

next decade.

Fuel Economy Jun 30 2022 Concern about the reduced availability and the increased cost of petroleum fuels prompted great efforts in recent years to reduce the fuel consumption of auto mobiles. The ongoing efforts to reduce fuel consumption have addressed many relevant factors, including increased engine performance, reduced friction, use of lightweight materials, and reduced aerodynamic drag. The results of the investigations assessing the various factors affecting fuel economy have been published in journals, conference proceedings, and in company and government reports. This proliferation of technical information makes it difficult for workers to keep abreast of aU developments. The material presented in this book brings together in a single volume much of the relevant materials, summarizes many of the state-of-the-art theories and data, and provides extensive lists of references. Thus, it is hoped that this book will be a useful reference for specialists and practicing engineers interested in the fuel economy of automobiles.

Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles Aug 28 2019 Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles evaluates various technologies and methods that could improve the fuel economy of medium- and heavy-duty vehicles, such as tractor-trailers, transit buses, and work trucks. The book also recommends approaches that federal agencies could use to regulate these vehicles' fuel consumption. Currently there are no fuel consumption standards for such vehicles, which account for about 26 percent of the transportation fuel used in the U.S. The miles-per-gallon measure used to regulate the fuel economy of passenger cars. is not appropriate for medium- and heavy-duty vehicles, which are designed above all to carry loads efficiently. Instead, any regulation of medium- and heavy-duty vehicles should use a metric that reflects the efficiency with which a vehicle moves goods or passengers, such as gallons per ton-mile, a unit that reflects the amount of fuel a vehicle would use to carry a ton of goods one mile. This is called load-specific fuel consumption (LSFC). The book estimates the improvements that various technologies could achieve over the next decade in seven vehicle types. For example, using advanced diesel engines in tractor-trailers could lower their fuel consumption by up to 20 percent by 2020, and improved aerodynamics could yield an 11 percent reduction. Hybrid powertrains could lower the fuel

consumption of vehicles that stop frequently, such as garbage trucks and transit buses, by as much 35 percent in the same time frame.

Hydrogen-Ethanol Dual Fuel - For Future Engine Fuel Demands May 06 2020 This book focuses on the feasibility of operating Spark Ignition engines on hydrogen-ethanol dual fuels. Hydrogen-Ethanol could be the best option of dual fuelling, which not only minimizes all types of exhaust emissions but also has better power outputs, complete and strong combustion and smooth engine operation. However handling, delivery and injection of hydrogen requires additional care. The important improvement of hydrogen addition is to reduce the Specific fuel consumption of ethanol engines. Recent activities on that matter focus on hydrogen blended ethanol engines rather than pure hydrogen combustion engines due to its high costs and research needs. Today, in order to take the advantages of the fossil fuels, which are being consumed rapidly, we need to adapt ourselves to such dual fuel systems. Hydrogen fuel is a very strong candidate for being used in dual fuel applications with ethanol due to a main reason that it has an advantage of being found everywhere. The present book relies on the idea of low emission and high efficiency advantages of hydrogen, which would lead hydrogen blended ethanol engines in the near future.

Fuel Consumption and Consumption Optimization Apr 28 2022 The aim of this work, consisting of 9 individual, self-contained booklets, is to describe commercial vehicle technology in a way that is clear, concise and illustrative. Compact and easy to understand, it provides an overview of the technology that goes into modern commercial vehicles. Starting from the customer's fundamental requirements, the characteristics and systems that define the design of the vehicles are presented knowledgeably in a series of articles, each of which can be read and studied on their own. In this volume, *Fuel Consumption and Consumption Optimization*, the main focus is placed on the factors for optimizing consumption in the conventional vehicle. Fuel consumption can be optimized by four different factors: the technology of the vehicle, the conditions of its operation, the behavior of the driver and the maintenance and upkeep of the vehicle. These aspects are described in a way that is easily understood for training and practical application.

A Report on Automotive Fuel Economy Aug 09 2020

Combustion in Piston Engines Apr 04 2020 Combustion in Piston Engines presents the technique of pressure diagnostics to measure the fuel consumption in an engine cylinder and to monitor the operation of micro-electronic systems for its control. It provides a recipe for bridging the gap between the hydrocarbon-fed combustion technology of automotive powerplants of today and electro-magnetic technologies of the future. The author proposes and introduces a model for the design of a MECC (micro-electronically controlled combustion) systems to modulate combustion in engine cylinders. This system yields significant reduction in the formation of pollutants and the consumption of fuel, so that, eventually, emissions using any clean hydrocarbon fuel will be acceptable and gas mileage could be doubled.

Improve FUEL AVERAGE (MPG / KMPL) Apr 16 2021 Book Description This book gives complete quantitative analysis of fuel consumption due to various factors like rolling resistance, air resistance etc. It gives very clear picture about how exactly mileage varies under different conditions. For better understanding of the subject different method is developed. Also practical simple method is developed to measure fuel consumption accurately in just few hundred meters of running. Large amount of literature is available about factors affecting fuel consumption like rolling resistance, air resistance, engine efficiency etc. But unfortunately neither any text book or any other literature is available for proper understanding of overall scenario at a glance as to how mileage of any vehicle is going to change

under different conditions. To fill in this gap, alternate method has been developed for calculating fuel consumption theoretically. This method makes it very easy to understand variation in mileage under different conditions. Also simple practical methods are given in the book for testing the vehicle for different parameters like rolling resistance, air resistance etc. just in few hundred meters of running. Variation in engine efficiency, particularly under part load condition is one of the major factor that affects fuel average. But unfortunately this aspect is not given its due importance. Further, due to continuously changing operating conditions such as speed, gear in which it is operated, acceleration, gradient, braking, idling etc it is extremely difficult to visualize how fuel average changes. Normal testing method of running vehicle over longer distance & measuring fuel average therefore do not give consistent reading. Moreover, it does not help to understand behavioral pattern of fuel average. Therefore for better understanding of the subject, different method is developed. In this method, fuel consumption at constant speed in any gear is measured. For this, method has been developed to measure fuel consumption just in few seconds & in just few hundred meters of running. In each gear, 4/5 readings are taken at different speeds. Similar readings are taken for each gear. These are then shown in graphs for each gear which enable us to understand variation in fuel consumption at a glance. Also for calculating fuel consumption theoretically, alternate method is developed. Salient features of this method are -i. Fuel consumption due to engine friction is accounted separately. ii. Due to above, remaining part of fuel consumption is directly proportional to energy requirement. This simplifies accounting. iii. Calculating energy requirement for overcoming rolling resistance, air resistance etc. is easy as lot of literature is available on this. iv. Once we know the energy requirement, we can calculate fuel consumption simply by multiplying with conversion factor. v. Using above method we can easily calculate fuel consumption for running the vehicle at any given speed in any gear. vi. Also it is possible to calculate fuel consumption due to each factor e.g. rolling resistance, air resistance & engine friction separately. vii. In this method there is no need to account for fuel consumption due to acceleration or gradient. Practical testing methods are also given in the book for measurement of air resistance, rolling resistance & engine friction, just in few minutes without any instruments.

The influence of engine and vehicle constructions to fuel consumption and air pollution Jan 14 2021 Doctoral Thesis / Dissertation from the year 2018 in the subject Electrotechnology, grade: 3.91, , language: English, abstract: This work analyses and explains the influence of engine and vehicles constructions to fuel the consumption and emission of harmful gases. The work states how new innovations, mostly personal vehicles, contribute to increased air pollution and some innovations which contribute to the reduction of air pollutions, which are ignored in the interest of car manufacturers and their profit they make keeping technology as it is. It is quite explicit, that most of the innovations made on recent manufactured cars are simply done to attract buyers as such modifications improve the vehicle's performances but do not contribute to green environment. Several examples are stated where it is clearly explained how some existing technologies can be used to reduce the emission of harmful gases as well as

some suggestions of modified technologies which would also contribute to the reduction of air pollution.

Detailed Modeling of Si Engines in Fuel Consumption Simulations for Functional Analysis Sep 21 2021 The aim of this thesis is to establish a coupled modeling approach to simulate fuel consumption and in-cylinder gas emissions of a passenger car in various driving cycles (NEDC, RDE, WLTP). Combining models of the engine control unit and the mechanical vehicle powertrain with a crank-angle based combustion engine simulation opens up the possibility to support the development and calibration of future engines, demonstrated here for a turbo-charged spark ignited engine with direct injection and a fully-variable valvetrain. Thermodynamic processes are implemented within a 1D gas exchange model which allows to consider not only steady-state but also transient engine operation. The coupled system is extended by calculations of engine-out emissions considering the formation of nitrogen oxide (NO_x), carbon monoxide (CO), and hydrocarbons (HC). Furthermore, tailpipe emissions are determined in an additional simulation model. The successful validation of this complex coupling technique is presented with exemplary results from all stages of the validation process. Finally, the advantage of this simulation methodology is shown by several application examples demonstrating the attained capabilities.

Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles May 30 2022 The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

Technological Improvements to Automobile Fuel Consumption. Volume I: Executive Summary. Final Report May 18 2021

Fuel Efficient Car Technology Sep 09 2020 Presents measures designed to reduce fuel consumption in passenger cars.

Assessment of Fuel Economy Technologies for Light-Duty Vehicles Nov 04 2022 Various combinations of commercially available technologies could greatly reduce fuel consumption in passenger cars, sport-utility vehicles, minivans, and other light-duty vehicles without compromising vehicle performance or safety. *Assessment of Technologies for Improving Light Duty Vehicle Fuel Economy* estimates the potential fuel savings and costs to consumers of available technology combinations for three types of engines: spark-ignition gasoline, compression-ignition diesel, and hybrid. According to its estimates, adopting the full combination of improved technologies in medium and large cars and pickup trucks with spark-ignition engines could reduce fuel consumption by 29 percent at an additional cost of \$2,200 to the consumer. Replacing spark-ignition engines with diesel engines and components would yield fuel savings of about 37 percent at an added cost of approximately \$5,900 per vehicle, and replacing spark-ignition engines with hybrid engines and components would reduce fuel consumption by 43 percent at an increase of \$6,000 per vehicle. The book focuses on fuel consumption-the amount of fuel consumed in a given driving distance-because energy savings are directly related to the amount of fuel used. In contrast, fuel economy measures how far a vehicle will travel with a gallon of fuel. Because fuel consumption data indicate money saved on fuel purchases and reductions in carbon dioxide emissions, the book finds that vehicle stickers should provide consumers with fuel consumption data in addition to fuel economy information.
