*The Battle Of France Sep 28 2019 Peter Cornwell tells the story of the greatest air battle of the Second World War when six nations were locked in combat over north-western Europe for a traumatic six weeks in 1940. He describes the day-to-day events as the battle unfolds, and details the losses suffered by all six nations involved: Britain, France, Holland, Belgium, Germany and, rather belatedly, Italy. As far as RAF fighter squadrons in France were concerned, it was an all-Hurricane show, yet it was the Blenheim and Battle crews who suffered the brunt of the casualties. Every aircraft lost or damaged through enemy action while operating in France is listed together with the fate of the crews. The RAF lost more than a thousand aircraft of all types over the Western Front during the six-week battle, the French Air Force 1,400, but Luftwaffe losses were even higher at over 1,800 aircraft.*

**A Pragmatic Approach to Business Ethics** Jul 27 2019 "Michalos... offers his own approach to the topic in this clearly written (with humorous tone), well-structured, fully reasoned, and courageous presentation. . . . Each chapter offers a great deal of information, discusses numerous arguments, and takes an unambiguous stand. . . . the reader. . . will certainly benefit from this fairly broad approach to business ethics." --G. Enderle in *Choice* "Alex C. Michalos exemplifies how one proceeds on the assumption that 'God dwells in the details,' and how one engages in an increasingly fuzzy world by balancing principled commitment and skepticism. As a direct result, you will find yourself getting sucked into a dialogue about things that matter to you, which is the whole point of *A Pragmatic Approach to Business Ethics*." --Jonathan B. King, Associate Professor of Management, Oregon State University "Professor Michalos has produced a marvelously valuable collection of work here. . . . To my knowledge, Professor Michalos has produced the only business ethics text marketed today that examines critical ethical issues from a consistently pragmatic perspective. In 'Ethical Considerations in Evaluation,' Michalos develops a rigorous model demonstrating the compatibility of ethical and rational decision making. 'Fourteen Unsuccessful Ways to Pass the Buck' presents fourteen thoughtful refutations of the argument that business people do not have moral responsibilities. What's the matter with Machiavellian ethics? 'The Best and Worst Arguments for Business Ethics' probes that question provocatively. Trust--an informed propensity to allow oneself to be vulnerable to harm in the interest of some perceived greater good--may be the single most important virtue to be gained from a study of *A Pragmatic Approach to Business Ethics*. . . . Michalos has done an outstanding job and I am confident that his text will be widely adopted." --Bill Shaw, Woodson Centennial Professor, Legal and Ethical Studies in Business, University of Texas, Austin "This book provides a very wide-ranging collection of examples of where business ethics make a difference - advertising, tobacco promotion, manufacture and marketing of armaments, concentration and taxation of wealth and the North American Free Trade Agreement. A well-presented collection of evidence that business and ethics can go together and provides support for a pragmatic approach." --*Journal of Management Psychology* Alex C. Michalos, long-time Editor-in-Chief of the *Journal of Business Ethics*, argues for a pragmatic approach to business ethics and demonstrates the usefulness of the approach by applying it to a variety of issues within this remarkable book. The issues discussed are broad and far-reaching and include the relations between rational and moral/ethical decision making, the limits of loyalty to employers, the impact of trust on business, and the role of commercial public opinion polling during elections. Michalos also covers advertising, tobacco promotion, manufacture and marketing of armaments, concentration and taxation of wealth, and the North American Free Trade Agreement. Provocative and insightful, *A Pragmatic Approach to Business Ethics* provides a foundation for business ethics that is essential. This volume will be of interest to professionals in all fields and to students and scholars in business ethics and social issues in business courses.

**Quantitative Assessment in Arms Control** Oct 02 2022 This book originates in a series of contributions to the 1983 Systems Science Seminar at the Computer Science Department of the German Armed Forces University Munich. Under the topic "Quantitative Approaches to Arms Control" that seminar attempted to review the present state-of-the-art of systems analysis and numerical methods in arms control. To this end, the editors invited a number of experts from Europe, the United States and Canada to share and discuss their views and assessments with the faculty and upper class computer science students of the university as well as numerous guests from the defence community and the interested public. In three parts, this book presents a selection of partly revised and somewhat extended versions of the seminar presentations followed, in most cases, by brief summaries of the transcripts of the respective discussions. In addition to an introduction by the editors, part I contains six papers on the present state and problems of arms control with emphasis on START (Strategic Arms Reduction Talks), INF (Intermediate-range Nuclear Forces negotiations), and MBFR (Mutually Balanced Force Reduction talks). The seven contributions to part II are devoted to mathematical models of arms competition and quantitative approaches to force balance assessment of both, the static and dynamic variety. Part III presents five papers which address technical and operational aspects and legal implications of arms control negotiations and verification.

**Neutron-Transmutation-Doped Silicon** Jun 05 2020 This volume contains the papers presented at the Third International Conference on Neutron Transmutation Doping of Silicon held in Copenhagen on August 27-29, 1980. The first symposium associated with neutron transmutation doping technology as such was arranged in 1976 at Oak Ridge National Laboratory by John Cleland. At this time it had become clear that the technology could be implemented on a commercial scale and that several types of power devices in the electronic industry would benefit from employing neutron transmutation doped silicon in the fabrication processes. Two years later the Second International Conference on Neutron Transmutation Doping of Semiconductors was arranged at the University of Missouri, Columbia, by Jon Meese. On this occasion the various aspects of silicon fabrication were reviewed, including irradiation control, radiation induced defects, device optimization, and possible benefits of irradiating other semiconductor compounds. In view of the now wide spread acceptance of neutron doped silicon in the power device industry the present conference was largely directed towards the current status of transmutation doping of silicon. Accordingly, the scope of the three day conference was to review developments in the technology which had occurred during the two years which had passed since the previous conference. In addition, brief accounts were given with respect to other semiconducting compounds and emerging irradiation techniques which may impact on device design principles in the future.

**INVERSE OPTIMAL CONTROL AND INVERSE NONCOOPERATIVE DYNAMIC GAME THEORY** Jun 25 2019 This book presents a novel unified treatment of inverse problems in optimal control and noncooperative dynamic game theory. It provides readers with fundamental tools for the development of practical algorithms to solve inverse problems in control, robotics, biology, and economics. The treatment involves the application of Pontryagin's minimum principle to a variety of inverse problems and proposes algorithms founded on the elegance of dynamic optimization theory. There is a balanced emphasis between fundamental theoretical questions and practical matters. The text begins by providing an introduction and background to its topics. It then discusses discrete-time and continuous-time inverse optimal control. The focus moves on to differential and dynamic games and the book is completed by consideration of relevant applications. The algorithms and theoretical results developed in Inverse Optimal Control and Inverse Noncooperative Dynamic Game Theory provide new insights into information requirements for solving inverse problems, including the structure, quantity, and types of state and control data. These insights have significant practical consequences in the design of technologies seeking to exploit inverse techniques such as collaborative robots, driver-assistance technologies, and autonomous systems. The book will therefore be of interest to researchers, engineers, and postgraduate students in several disciplines within the area of control and robotics.
