*Explorations in Computing* Oct 21 2021 Based on the author's introductory course at the University of Oregon, *Explorations in Computing: An Introduction to Computer Science* focuses on the fundamental idea of computation and offers insight into how computation is used to solve a variety of interesting and important real-world problems. Taking an active learning approach, the text encourages students to explore computing ideas by running programs and testing them on different inputs. It also features illustrations by Phil Foglio, winner of the 2009 and 2010 Hugo Award for Best Graphic Novel. Classroom-Tested Material The first four chapters introduce key concepts, such as algorithms and scalability, and hone practical lab skills for creating and using objects. In the remaining chapters, the author covers "divide and conquer" as a problem solving strategy, the role of data structures, issues related to encoding data, computer architecture, random numbers, challenges for natural language processing, computer simulation, and genetic algorithms. Through a series of interactive projects in each chapter, students can experiment with one or more algorithms

that illustrate the main topic. Requiring no prior experience with programming, these projects show students how algorithms provide computational solutions to real-world problems. Web Resource The book's website at [www.cs.uoregon.edu/eic](http://www.cs.uoregon.edu/eic) presents numerous ancillaries. The lab manual offers step-by-step instructions for installing Ruby and the RubyLabs gem with Windows XP, Mac OS X, and Linux. The manual includes tips for editing programs and running commands in a terminal emulator. The site also provides online documentation of all the modules in the RubyLabs gem. Once the gem is installed, the documentation can be read locally by a web browser. After working through the in-depth examples in this textbook, students will gain a better overall understanding of what computer science is about and how computer scientists think about problems.

Getting to the Common Core Oct 09 2020 The Common Core Standards have recently been adopted in most states across the nation and teachers are in the process of getting to the core of these standards. Teaching to standards is not a new concept;

teachers have adapted to new standards every few years for quite some time. And teachers are adaptable, as can be seen in this book. We are writing this book to demonstrate how teachers use research-based strategies to meet Common Core Standards while still focusing on students. Our goal is to help teachers visualize students in action as other teachers describe the implementation of research-based strategies in their own classrooms, show student work samples, and provide reflections of student success in achieving the standards. Many Common Core Standards books focus on the standards, but our approach focuses on strategies that engage the students in the classroom--showing how different teachers at varying grade levels have used the strategies to meet the standards. With this focus, we believe that teachers gain a new and positive perspective on approaching the new standards and see the flexibility of strategies for meeting standards across subject areas. We have examined research on the strategies with the purpose of giving teachers a brief description of why these strategies work before giving actual examples from classrooms. We also work closely with teachers in the public schools and have our finger on the pulse of what is happening in the public schools—one of the current stressors being unpacking the Common Core Standards. This book actually focuses on practice. We begin by laying out a rationale in our first chapter---The Core Value(s) of Education. Then, each chapter focuses on a strategy, including 1) a brief description about the research supporting each strategy and 2) several examples from different grade levels, which include a description of how the strategy was used, student work samples, and a reflection on the use of the strategy. The research descriptions are fairly short because, while we believe professional educators (aka teachers, in this case) should know the research that supports practice, we know they are not

typically interested in long diatribes about the research.

*Software Applications: Concepts, Methodologies, Tools, and Applications* Jul 06 2020 Includes articles in topic areas such as autonomic computing, operating system architectures, and open source software technologies and applications.

**Web 2.0 Tools in Concept Teaching** Apr 02 2020 Currently, students are interested in more than one thing at the same time, preferring to use visuals and infographics, rather than writing, in the learning process. In addition, these students use technology

better in the education process, as in all aspects of daily life, as they meet technology at an earlier age than their teachers. Therefore, teachers should also update themselves according to these learner characteristics. In particular, “assessment” and “evaluation” are two of the topics that students may not enjoy to their fullest extent. This book serves to make the assessment process fun and interactive, as well as to inform teachers about the different applications they can do in this process. It invites teachers to introduce highly interactive applications and make their classes active in the learning process.
