calculus can be applied to equations expressed in polar coordinates the angular coordinate ϕ is expressed in radians throughout this section which is the conventional choice when doing calculus differential calculus using $x = r \cos \phi$ and $y = r \sin \phi$ one can derive a relationship between derivatives in cartesian and polar coordinates

what we'll see in this video is
the solution to a differential
equation isn't a value or a set
of values it's a function or a set
of functions but before we go

about actually trying to solve
this or figure out all of the
solutions let's test whether
certain equations certain
functions are solutions to this
differential equation
