*Vibrational Spectroscopy in Life Science* Jan 16 2022 The authors describe basic theoretical concepts of vibrational spectroscopy, address instrumental aspects and experimental procedures, and discuss experimental and theoretical methods for interpreting vibrational spectra. It is shown how vibrational spectroscopy provides information on general aspects of proteins, such as structure, dynamics, and protein folding. In addition, the authors use selected examples to demonstrate the application of Raman and IR spectroscopy to specific biological systems, such as metalloproteins, and photoreceptors. Throughout, references to extensive mathematical and physical aspects, involved biochemical features, and aspects of molecular biology are set in boxes for easier reading. Ideal for undergraduate as well as graduate students of biology, biochemistry, chemistry, and physics looking for a compact introduction to this field.

**A History of the Life Sciences** Jun 21 2022 A clear and concise survey of the major themes and theories embedded in the history of life science, this book covers the development and significance of scientific methodologies, the relationship between science and society, and the diverse ideologies and

current paradigms affecting the evolution and progression of biological studies. The author discusses cell theory, embryology, physiology, microbiology, evolution, genetics, and molecular biology; the Human Genome Project; and genomics and proteomics. Covering the philosophies of ancient civilizations to modern advances in genomics and molecular biology, the book is a unique and comprehensive resource.

**International Entrepreneurship in the Life Sciences** May 20 2022 'The processes of internationalization, innovation and venture-creation in high-technology new ventures are inextricably intertwined. This is particularly true in the uncertain and troubled waters of the life sciences industry where startups with very uncertain futures are required to face significant challenges in short windows of opportunity. Navigating these waters is not straightforward, either for those immediately involved in it, or for those trying to understand it. This book is a must-read for anyone who is serious about understanding entrepreneurship in the biotechnology industry.' Alberto Onetti, CrESIT (Research Center for Innovation and Life Science Management), Italy In this thought-provoking book, leading experts explore why international entrepreneurship is important to the life sciences industry. From multi-disciplinary and cross-national perspectives, they question why international entrepreneurship scholars might usefully invest interest in research focused on one specific industry context. The book addresses contemporary challenges of relevance to life science firms and draws on leading-edge debates in international entrepreneurship research. Topics include: the nature of the born-global firm; the development of international capabilities and competencies; the role of local and international partnerships and alliances; competitiveness, opportunity recognition and orientation; and the role of specialized complementary assets in internationalization. It concludes by proposing an agenda for future research across the underpinning fields of innovation, entrepreneurship and internationalization. This book will prove a stimulating read for academics, students and researchers with an interest in international business, management and entrepreneurship, as well as for practitioners in the health professions or life sciences academics who are, or may become, entrepreneurs.

**Research Handbook on Intellectual Property and the Life Sciences** Oct 21 2019 Intellectual property (IP) is a key component of the life sciences, one of the most dynamic and innovative fields of technology today. At the same time, the relationship between IP and the life sciences raises new public policy dilemmas. The Research Handbook on Intellectual Property and the Life Sciences comprises contributions by leading experts from academia and industry to provide in-depth analyses of key topics including pharmaceuticals, diagnostics and genes, plant innovations, stem cells, the role of competition law and access to medicines. The Research Handbook focuses on the relationship between IP and the life sciences in Europe and the United States, complemented by country-specific case studies on Australia, Brazil, China, India, Japan, Kenya, South Africa and Thailand to provide a truly international perspective.

**Life Science Ethics** May 28 2020 Does nature have intrinsic value? Should we be doing more to save wilderness and ocean ecosystems? What are our duties to future generations of humans? Do animals have rights? This revised

edition of "Life Science Ethics" introduces these questions using narrative case studies on genetically modified foods, use of animals in research, nanotechnology, and global climate change, and then explores them in detail using essays written by nationally-recognized experts in the ethics field. Part I introduces ethics, the relationship of religion to ethics, how we assess ethical arguments, and a method ethicists use to reason about ethical theories. Part II demonstrates the relevance of ethical reasoning to the environment, land, farms, food, biotechnology, genetically modified foods, animals in agriculture and research, climate change, and nanotechnology. Part III presents case studies for the topics found in Part II.

*Leadership in the Life Sciences* Jul 10 2021 The healthcare professionals who save and extend our lives are helpless without the medicines and technologies that have revolutionised medical care. But the industry that invents, makes and provides these indispensable tools is transforming under the pressure of ageing populations, globalisation and revolutions in biological and information technology. How this industry adapts and evolves is vitally important to every one of us. This book looks inside the heads and hearts of the people who lead the global pharmaceutical and medical technology industry. It describes how they make sense of their markets and the wider life sciences economy. It reveals what they have learned about how to lead large, complex organisations to compete in dynamic, global markets. *Leadership in the Life Sciences* is essential reading for anyone working in or with the pharmaceutical and medical technology industry and its halo of supporting companies. Written as ten succinct lessons, it gives the reader unique insight into what the industry's leaders are thinking. Covering topics from leadership to organisational culture, from change management to digital disruption and from competitive strategy to value-creation, each chapter distils the accumulated wisdom of those who lead the complex and turbulent life sciences industry.

**New Perspectives on the History of Life Sciences and Agriculture** Apr 07 2021 This volume explores problems in the history of science at the intersection of life sciences and agriculture, from the mid-eighteenth to the mid-twentieth century. Taking a comparative national perspective, the book examines agricultural practices in a broad sense, including the practices and disciplines devoted to land management, forestry, soil science, and the improvement and management of crops and livestock. The life sciences considered include genetics, microbiology, ecology, entomology, forestry, and deal with US, European, Russian, Japanese, Indonesian, Chinese contexts. The book shows that the investigation of the border zone of life sciences and agriculture raises many interesting questions about how science develops. In particular it challenges one to re-examine and take seriously the intimate connection between scientific development and the practical goals of managing and improving – perhaps even recreating – the living world

to serve human ends. Without close attention to this zone it is not possible to understand the emergence of new disciplines and transformation of old disciplines, to evaluate the role and impact of such major figures of science as Humboldt and Mendel, or to appreciate how much of the history of modern biology has been driven by national ambitions and imperialist expansion in competition with rival nations.

Business Modeling for Life Science and Biotech Companies Aug 31 2020 Most books on the biotechnology industry focus on scientific and technological challenges, ignoring the entrepreneurial and managerial complexities faced bio-entrepreneurs. The Business Models for Life Science Firms aims to fill this gap by offering managers in this rapid growth industry the tools needed to design and implement an effective business model customized for the unique needs of research intensive organizations. Onetti and Zucchella begin by unpacking the often-used 'business model' term, examining key elements of business model conceptualization and offering a three tier approach with a clear separation between the business model and strategy: focus, exploring the different activities carried out by the organization; locus, evaluating where organizational activities are centered; and modus, testing the execution of the organization's activities. The business model thus defines the unique way in which a company delivers on its promise to its customers. The theory and applications adopt a global approach, offering business cases from a variety of biotech companies around the world.

Mathematics for the Life Sciences Aug 11 2021 An accessible undergraduate textbook on the essential math concepts used in the life sciences The life sciences deal with a vast array of problems at different spatial, temporal, and organizational scales. The mathematics necessary to describe, model, and analyze these problems is similarly diverse, incorporating quantitative techniques that are rarely taught in standard undergraduate courses. This textbook provides an accessible introduction to these critical mathematical concepts, linking them to biological observation and theory while also presenting the computational tools needed to address problems not readily investigated using mathematics alone. Proven in the classroom and requiring only a background in high school math, Mathematics for the Life Sciences doesn't just focus on calculus as do most other textbooks on the subject. It covers deterministic methods and those that incorporate uncertainty, problems in discrete and continuous time, probability, graphing and data analysis, matrix modeling, difference equations, differential equations, and much more. The book uses MATLAB throughout, explaining how to use it, write code, and connect models to data in examples chosen from across the life sciences. Provides undergraduate life science students with a succinct overview of major mathematical concepts that are essential for modern biology Covers all the major quantitative concepts that national reports have identified as the ideal components of an entry-level course for life science students Provides good background for the MCAT, which now includes data-based and statistical reasoning Explicitly links data and math modeling Includes end-of-chapter homework problems, end-of-unit student projects, and select answers to homework problems Uses MATLAB throughout, and MATLAB m-files with an R supplement are available online Prepares students to read with comprehension the growing quantitative literature across the life

sciences A solutions manual for professors and an illustration package is available

**Encyclopedia of Life Sciences** Nov 14 2021 The Encyclopedia of Life Sciences volumes 1-26 comprises the original 20 volumes of ELS (published in 2002) plus six supplementary volumes (published in 2007). Volumes 21-26 collates all the information that has been added to the online version on WileyInterSciences since the publication of the first 20-volume set. Together, they provide the reader with the most comprehensive and the up-to-date information in Life Sciences. Spanning the entire spectrum of life sciences, the Encyclopedia of Life Sciences (ELS) features more than 4,000 specially commissioned and peer-reviewed articles, making it an essential read for life scientists and a valuable resource for teaching. Aimed at researchers, students and teachers, articles provide comprehensive and authoritative coverage, written by leaders in the field. Colour illustrations and tables accompany articles, with appendix and glossary material providing essential information for the non-specialist, including biochemical and taxonomic information, acronyms, synonyms, units and other technical data. Importantly, all articles have been peer-reviewed to ensure a balanced representation of the literature. Articles are divided into three different categories indicating their level of complexity: Introductory, Advanced and Keynote. Introductory articles have been written primarily for undergraduate and non-specialists requiring the basic concepts of a particular subject. Advanced articles provide a more detailed discussion of specialist subjects, equivalent to that found in graduate level texts. Keynote articles provide a platform for debate where controversial issues and 'hot topics' can be discussed. Coverage includes: Biochemistry Cell Biology Developmental Biology Ecology Evolution and Diversity of Life Functional and Comparative Morphology Genetics and Disease Genetics and Molecular Biology Immunology Microbiology Neuroscience Plant Science Science and Society Structural Biology Virology

**Experimental Procedures in Life Sciences** Sep 12 2021 This is a manual for all life science students studying courses in biochemistry, biotechnology, botany, genetics, microbiology, molecular biology, zoology, nursing, and medicine, based on the author's decades-long experience in the field experiments of life sciences teaching and research.

**Biology** Mar 06 2021 Here is the essential guide to biology, an authoritative reference book and timeline that examines how we have uncovered the secrets of life--the most complex process in the Universe. From the workings of molecules to the way entire oceans or continents of lifeforms interact, biology seeks to understand how it is that something can be alive, how it fends off death and how it leaves more life in its wake. We follow the journey through the history of life science to find out why the dolphin got its name (it is the 'womb fish'), how a seven-foot strand of DNA is able to build your body, and what gives a lobster its blue blood. The great names, such as Darwin and Linnaeus, are joined by lesser known discoverers, such as Karl von Frisch who discovered that bees dance, and Jan Baptist van Helmont who found a plant uses air and water to grow. Biology today is still very much a live science, finding a purpose in robot design and helping us to understand non-living complex systems like the Internet. Biology has changed the way we understand ourselves. What will it tell us next? - Contains 100 chronological articles that tell the story of biology from the dawn of history to the present day - Authoritative text, exciting imagery and helpful diagrams accompany each of the steps along the way - Biographies of great life scientists and a chart of the tree of life - A simple guide to biology draws together current understanding to set out the basics of the science - The Imponderables looks at what questions biology still needs to answer. Also contains a 24-page removable foldout concertina neatly housed at the back of the book. This fold-out concertina includes a 12-page Timeline History of Biology and 12 full pages of amazing electron micrographs called Our Hidden World.

**Mathematics for Life Science and Medicine** Oct 01 2020 The purpose of this volume is to present and discuss the many rich properties of the dynamical systems that appear in life science and medicine. It provides a fascinating survey of the theory of dynamical systems in biology and medicine. Each chapter will serve to introduce students and scholars to the state-of-the-art in an exciting area, to present new results, and to inspire future contributions to mathematical modeling in life science and medicine.

*Physics of the Life Sciences* Oct 25 2022 Each chapter has three types of learning aides for students: open-ended questions, multiple-choice questions, and quantitative problems. There is an average of about 50 per chapter. There are also a number of worked examples in the chapters, averaging over 5 per chapter, and almost 600 photos and line drawings.

**The Handbook of Marketing Strategy for Life Science Companies** Sep 19 2019 The proposed book follows in the same steps as the first book in the series, The Handbook of Market Research for Life Sciences. While the first book focused on the techniques and methodologies to collect the market data you need to evaluate your market as well as presentation models for your data, the second volume will focus more on the commercialization elements of marketing. As such, this book will be covering a wide range of topics directly tied to marketing management such as marketing and

commercialization strategies, consumers' behaviors, marketing metrics, pricing techniques and strategies as well as marketing communications (public relations, advertising, and more). The objective of this book is to focus exclusively on the marketing aspects for life sciences, providing entrepreneurs with a toolkit of tools they can use throughout the marketing process, from market planning to commercialization. The overall objective is for them to gain an understanding on the marketing function, ask the right question, and be able to tackle simple to complex topics.

**Molecular Life Sciences** Dec 23 2019 Handbook of Molecular Life Sciences will focus on understanding biological phenomena at the level of molecules and their interactions that govern life processes. Volumes 1 to 3 will focus on genes and genomes, volumes 4 to 6 on protein structure and function, volumes 7 & 8 will explore systems biology, using genomics and proteomics as the focus and volumes 9 and 10 on molecular aspects of cell structure and function. Volume 11 will explore unifying concepts and theory from biology, chemistry, mathematics and physics that are essential for understanding the molecular life sciences and will also include sections on teaching perspectives and assessment tools. Volume 12 will cover basic aspects of the various experimental approaches that are used in the Molecular Life Sciences.

*Kinetics for the Life Sciences* Aug 19 2019 The aim of the book is to introduce the reader to the kinetic analysis of a wide range of biological processes at the molecular level. It is intended to show that the same approach can be used to resolve the number of steps in enzyme reactions, muscle contraction, visual perception and ligand binding receptors that trigger other physiological processes. Attention is also given to methods for characterizing these steps in chemical terms. Although the treatment is mainly theoretical, a wide range of examples and experimental techniques are also introduced and an historical approach is used to demonstrate the development of the theory and experimental techniques of kinetic analysis in biology.

Innovative Research in Life Sciences Feb 05 2021 "I thoroughly enjoyed reading this book as it has taken me on a journey through time, across the globe and through multiple disciplines. Indeed, we need to be thinking about these concepts and applying them every day to do our jobs better." Farah Magrabi, Macquarie University, Australia "The reader will find intriguing not only the title but also the content of the book. I'm also pleased that public health, and even more specifically epidemiology has an important place in this ambitious discussion." Elena Andresen, Oregon Health & Science University, USA "This book is very well written and addresses an important topic. It presents many reasons why basic scientists/researchers should establish collaborations and access information outside traditional means and not limit thinking but rather expand such and perhaps develop more innovative and translational research ventures that will advance science and not move it laterally." Gerald Pepe, Eastern Virginia Medical School, USA "This book gathers logically and presents interestingly (with many examples) the qualities and attitudes a researcher must possess in order to become successful. On the long run, the deep and carefully reexamined research will be the one that lasts." Zoltán Néda, Babeş-Bolyai University, Romania "I really liked the five pillars delineating the components of humanism in

research. This book has made a major contribution to the research ethics literature." David Fleming, University of Missouri, USA A comprehensive review of the research phase of life sciences from design to discovery with suggestions to improve innovation This vital resource explores the creative processes leading to biomedical innovation, identifies the obstacles and best practices of innovative laboratories, and supports the production of effective science. Innovative Research in Life Sciences draws on lessons from 400 award-winning scientists and research from leading universities. The book explores the innovative process in life sciences and puts the focus on how great ideas are born and become landmark scientific discoveries. The text provides a unique resource for developing professional competencies and applied skills of life sciences researchers. The book examines what happens before the scientific paper is submitted for publication or the innovation becomes legally protected. This phase is the most neglected but most exciting in the process of scientific creativity and innovation. The author identifies twelve competencies of innovative biomedical researchers that described and analyzed. This important resource: Highlights the research phase from design to discovery that precedes innovation disclosure Offers a step by step explanation of how to improve innovation Offers solutions for improving research and innovation productivity in the life sciences Contains a variety of statistical databases and a vast number of stories about individual discoveries Includes a process of published studies and national statistics of biomedical research and reviews the performance of research labs and academic institutions Written for academics and researchers in biomedicine, pharmaceutical science, life sciences, drug discovery, pharmacology, Innovative Research in Life Sciences offers a guide to the creative processes leading to biomedical innovation and identifies the best practices of innovative scientists and laboratories.

Data Integration in the Life Sciences Oct 13 2021 This book constitutes the refereed proceedings of the 5th International Workshop on Data Integration in the Life Sciences, DILS 2008, held in Evry, France in June 2008. The 18 revised full papers presented together with 3 keynote talks and a tutorial paper were carefully reviewed and selected from 54 submissions. The papers adress all current issues in data integration and data management from the life science point of view and are organized in topical sections on Semantic Web for the life sciences, designing and evaluating architectures to integrate biological data, new architectures and experience on using systems, systems using technologies from the Semantic Web for the life sciences, mining integrated biological data, and new features of major resources for biomolecular data.

Data and Text Processing for Health and Life Sciences Dec 03 2020 This open access book is a step-by-step introduction on how shell scripting can help solve many of the data processing tasks that Health and Life specialists face everyday with minimal software dependencies. The examples presented in the book show how simple command line tools can be used and combined to retrieve data and text from web resources, to filter and mine literature, and to explore the semantics encoded in biomedical ontologies. To store data this book relies on open standard text file formats, such as TSV, CSV, XML, and OWL, that can be open by any text editor or spreadsheet application. The first two chapters, Introduction and Resources, provide a brief introduction

to the shell scripting and describe popular data resources in Health and Life Sciences. The third chapter, Data Retrieval, starts by introducing a common data processing task that involves multiple data resources. Then, this chapter explains how to automate each step of that task by introducing the required commands line tools one by one. The fourth chapter, Text Processing, shows how to filter and analyze text by using simple string matching techniques and regular expressions. The last chapter, Semantic Processing, shows how XPath queries and shell scripting is able to process complex data, such as the graphs used to specify ontologies. Besides being almost immutable for more than four decades and being available in most of our personal computers, shell scripting is relatively easy to learn by Health and Life specialists as a sequence of independent commands. Comprehending them is like conducting a new laboratory protocol by testing and understanding its procedural steps and variables, and combining their intermediate results. Thus, this book is particularly relevant to Health and Life specialists or students that want to easily learn how to process data and text, and which in return may facilitate and inspire them to acquire deeper bioinformatics skills in the future.

*The Science of Life* Jun 16 2019

Socio-Life Science and the COVID-19 Outbreak Mar 18 2022 This open access book presents the first step towards building socio-life science, a field of science investigating humans in such a way that both social and life-scientific factors are integrated. Because humans are both living and social creatures, a human action can never be understood fully without knowing both the biological traits of a person and the social scientific environments in which he exists. With this consideration, the editors of this book have initiated a research project promoting a deeper and more integrated understanding of human behavior and human health. This book aims to show what can, and could be, achieved through our interdisciplinary project. One important product is the newly formed three-party collaboration between Pasteur Institut, Kyoto University, and the Research Institute of Economy, Trade and Industry. Covering many different fields, including medicine, epidemiology, anthropology, economics, sociology, demography, geography, and policy, researchers in these institutes, and many others, present their studies on the COVID-19 pandemic. Although based on different methodologies, the studies show the importance of behavioral change and governmental policy in the fight against a huge pandemic. The book explains the unique genome cohort-panel data that the project builds to study social and life scientific aspects of humans.

**Introduction to Instrumentation in Life Sciences** Apr 26 2020

Instrumentation is central to the study of physiology and genetics in living organisms, especially at the molecular level. Numerous techniques have been developed to address this in various biological disciplines, creating a need to understand the physical principles involved in the operation of research instruments and the parameters required in using them. Introduction to Instrumentation in Life Sciences fills this need by addressing different aspects of tools that hold the keys to cutting-edge research and innovative applications, from basic techniques to advanced instrumentation. The text describes all topics so even beginners can easily understand the theoretical and practical aspects. Comprehensive chapters encompass well-defined

methodology that describes the instruments and their corresponding applications in different scientific fields. The book covers optical and electron microscopy; micrometry, especially in microbial taxonomy; pH meters and oxygen electrodes; chromatography for separation and purification of products from complex mixtures; spectroscopic and spectrophotometric techniques to determine structure and function of biomolecules; preparative and analytical centrifugation; electrophoretic techniques; x-ray microanalysis including crystallography; applications of radioactivity, including autoradiography and radioimmunoassays; and fermentation technology and subsequent separation of products of interest. The book is designed to serve a wide range of students and researchers in diversified fields of life sciences: pharmacy, biotechnology, microbiology, biochemistry, and environmental sciences. It introduces different aspects of basic experimental methods and instrumentation. The book is unique in its broad subject coverage, incorporating fundamental techniques as well as applications of modern molecular and proteomic tools that are the basis for state-of-the-art research. The text emphasizes techniques encountered both in practical classes and in high-throughput environments used in modern industry. As a further aid to students, the authors provide well-illustrated diagrams to explain the principles and theories behind the instruments described.

**Chemistry for the Life Sciences** Feb 17 2022 Presents short topics tied to numerical or conceptual ideas, reinforced with worked examples and questions Retaining the user-friendly style of the first edition, this text is designed to eliminate the knowledge gap for those life sciences students who have not studied chemistry at an advanced level. It contains new chapters on

**Deep Learning for the Life Sciences** Apr 19 2022 Deep learning has already achieved remarkable results in many fields. Now it's making waves throughout the sciences broadly and the life sciences in particular. This practical book teaches developers and scientists how to use deep learning for genomics, chemistry, biophysics, microscopy, medical analysis, and other fields. Ideal for practicing developers and scientists ready to apply their skills to scientific applications such as biology, genetics, and drug discovery, this book introduces several deep network primitives. You'll follow a case study on the problem of designing new therapeutics that ties together physics, chemistry, biology, and medicine—an example that represents one of science's greatest challenges. Learn the basics of performing machine learning on molecular data Understand why deep learning is a powerful tool for genetics and genomics Apply deep learning to understand biophysical systems Get a brief introduction to machine learning with DeepChem Use deep learning to analyze microscopic images Analyze medical scans using deep learning techniques Learn about variational autoencoders and generative adversarial networks Interpret what your model is doing and how it's working

**Financing Life Science Innovation** Jun 09 2021 Financing Life Science Innovation reviews the literature on venture capital, corporate governance, and life science venturing and presents a study of the Swedish life science industry and the venture capital investors being active in financially and managerially supporting life science start-up firms.

*Practical Guide to Life Science Databases* Sep 24 2022 This book provides the latest information of life science databases that center in the life science research and drive the development of the field. It introduces the fundamental principles, rationales and methodologies of creating and updating life science databases. The book brings together expertise and renowned researchers in the field of life science databases and brings their experience and tools at the fingertips of the researcher. The book takes bottom-up approach to explain the structure, content and the usability of life science database. Detailed explanation of the content, structure, query and data retrieval are discussed to provide practical use of life science database and to enable the reader to use database and provided tools in practice. The readers will learn the necessary knowledge about the untapped opportunities available in life science databases and how it could be used so as to advance basic research and applied research findings and transforming them to the benefit of human life. Chapter 2 is available open access under a Creative Commons Attribution 4.0 International License via [link.springer.com](http://link.springer.com).

Scanning Electron Microscopy for the Life Sciences Jan 04 2021 A guide to modern scanning electron microscopy instrumentation, methodology and techniques, highlighting novel applications to cell and molecular biology.

Valuation in Life Sciences Feb 23 2020 Valuation is a hot topic among life sciences professionals. There is no clear understanding on how to use the different valuation approaches and how to determine input parameters. Some do not value at all, arguing that it is not possible to get realistic and objective numbers out of it. Some claim it to be an art. In the following chapters we will provide the user with a concise valuation manual, providing transparency and practical insight for all dealing with valuation in life sciences: project and portfolio managers, licensing executives, business developers, technology transfer managers, entrepreneurs, investors, and analysts. The purpose of the book is to explain how to apply discounted cash flow and real options valuation to life sciences projects, i.e. to license contracts, patents, and firms. We explain the fundamentals and the pitfalls with case studies so that the reader is capable of performing the valuations on his own and repeat the theory in the exercises and case studies. The book is structured in five parts: In the first part, the introduction, we discuss the role of the players in the life sciences industry and their particular interests. We describe why valuation is important to them, where they need it, and the current problems to it. The second part deals with the input parameters required for valuation in life sciences, i.e. success rates, costs, peak sales, and timelines.

Contested Categories Aug 23 2022 Drawing on social science perspectives, *Contested Categories* presents a series of empirical studies that engage with the often shifting and day-to-day realities of life sciences categories. In doing so, it shows how such categories remain contested and dynamic, and that the boundaries they create are subject to negotiation as well as re-configuration and re-stabilization processes. Organized around the themes of biological substances and objects, personhood and the genomic body and the creation and dispersion of knowledge, each of the volume's chapters reveals the elusive nature of fixity with regard to life science categories. With contributions from an international team of scholars, this book will be

essential reading for anyone interested in the social, legal, policy and ethical implications of science and technology and the life sciences.

Basic Organic Chemistry for the Life Sciences Jan 24 2020 This book is designed for students of biology, molecular biology, ecology, medicine, agriculture, forestry and other professions where the knowledge of organic chemistry plays the important role. The work may also be of interest to non-professionals, as well as to teachers in high schools. The book consists of 11 chapters that cover: - basic principles of structure and constitution of organic compounds, - the elements of the nomenclature, - the concepts of the nature of chemical bond, - introductions in NMR and IR spectroscopy, - the concepts and main classes of the organic reaction mechanisms, - reactions and properties of common classes of organic compounds, - and the introduction to the chemistry of the natural organic products followed by basic principles of the reactions in living cells.

**Physical Chemistry for the Life Sciences** Jul 18 2019 Peter Atkins and Julio de Paula offer a fully integrated approach to the study of physical chemistry and biology.

**Innovations in Life Science Research** Jun 28 2020

Value Practices in the Life Sciences and Medicine May 08 2021 Providing a compelling scholarly statement about the interrelation and pliability of values in the life sciences, medicine and health care, this volume aims to aid our understanding of the roles of power, knowledge production and economic action in the heavily scientised and economised areas of life science and medicine.
