The book first elaborates on alternating chain methods, average height of planted plane trees, and minimum spanning tree problem. Discussions focus on numbered graphs and difference sets, Euclidean models and complete graphs, classes and conditions for graceful graphs, and maximum matching problem. The manuscript then elaborates on the evolution of the path number of a graph, production of graphs by Cartesian product, and graph-theoretic programming language. Topics include FORTRAN characteristics of GTPL, design considerations, representation and identification of graphs in a computer, production of simple graphs and star topologies, and production of stars having a given topology. The book also examines the entropy of transformed finite-state automata and associated languages; counting hexagonal and triangular polyominoes; and square, cubical and general polyominoes. Graph coloring algorithms, algebraic isomorphism invariants for graphs of automata, and coding of various types of unlabeled trees are also discussed. The publication is a valuable source of information for researchers interested in graph theory and computing.

Your Brand, The Next Media Company 02 2020 Content is still king—and if you're a brand marketer, you need to start thinking like a media company, too. Your Brand, The Next Media Company brings together the strategic insights, operational frameworks, and practical approaches to transforming your brand into a highly successful media company. There is a content and media surplus in the marketplace, and there is an attention deficit in the minds of consumers today. Their lives are dynamic and completely unpredictable. They are highly influential and aid their peers in the purchase funnel using organic conversations about the products they care about and the ones they don't. In order to reach these consumers, you must create recent, relevant, and game changing content to break through the clutter and successfully change their behavior. Social business is the new norm. Michael Brito covers every step of the process, including: Understanding the unpredictable nature and dynamic behaviors of the social customer; Deploying social business strategies that will help facilitate the change from brand to media company; Building a content organization and setting the stage for transformation; Creating a real-time command center that will help facilitate reactive and proactive content marketing; Creating a content editorial team that will drive content strategy, governance, and cross-team collaboration; Building the content supply chain (workflows for content ideation, creation, approval, distribution, and integration); Enabling customers and employees (brand journalists) to feed the content engine; Developing your content strategy that can be executed across paid, earned, and owned media content; Transitioning from "brand messaging" to a highly engaging content narrative; Evaluating the content marketing vendors and software platforms vying for your business. Along the way, Brito presents numerous studies from brand leaders worldwide, including Red Bull, Oreo, Tesla Motors, Burberry, Sharpie, and Pepsi—delivering specific, actionable, powerful, and relevant insights you can act on to begin the transformation from brand to media company.

Medium Access Control in Wireless Networks Aug 29 2022 Wireless technologies and applications are becoming one of the fastest growing and most promising areas in recent years. To accommodate data transmission by multiple stations sharing the scarce wireless bandwidth, a medium access control (MAC) protocol plays a crucial role in scheduling packet transmission fairly and efficiently. The emerging wireless networks, such as ad-hoc networks, sensor networks or mesh networks, are mostly multi-hop based and in distributed manner, which brings a lot of problems and challenges in designing fine-tuned MAC protocols tailored for modern wireless network. In this book, the authors give complete and in-depth overviews to the classical MAC access control algorithms and the related protocols, as well as their applications in various wireless data networks especially the most successful Local Area Networks (WLAN). The book consists of three major parts. Part I of this book, including Chapters 1-7, is emphasizing on the fundamentals of medium access control algorithms and protocols. Chapter 1 provides an introduction to the wireless networks, such as overview of wireless network problems and challenges of the wireless networks, and the classifications of MAC protocols as well as the performance metrics. Chapter 2 reviews the important collision resolution algorithms applied in medium access controls, for example, the splitting algorithm and the backoff algorithm. Chapter 3 reviews the hybrid access control algorithms that combine both contention and allocation schemes. A series of important collision avoidance algorithms introduced in Chapters 4-7 respectively, with a specific design goal covered in each chapter. Chapter 4 focuses on the multi-channel MAC protocols for collision avoidance; Chapter 5 introduces the concepts of power control and power management in medium access control and how they can be applied in MAC protocol design; Chapter 6 presents how to provide Quality-of-Service (QoS) to multimedia wireless networks, in either centralized or distributed manner; and Chapter 7 explains how the smart antennas can be applied in the medium access control to provide high channel throughput and low packet collision.

Mathematical Modelling with Case Studies 2021 Mathematical Modelling with Case Studies: Using Maple™ and MATLAB®, Third Edition provides students with hands-on modelling skills for a wide variety of problems involving differential equations that describe rates of change. The book focuses on growth and decay processes, interacting populations, and heating/cooling problems, the mathematical techniques presented are applied to many other areas. The text carefully details the process of constructing a model, including the conversion of a seemingly complex problem into a much simpler one. It uses flow diagrams and word equations to aid in the model-building process and to develop the mathematical equations. Employing theoretical, graphical, and computational tools, the authors analyze the behavior of the models under changing conditions. The authors examine a model numerically before solving it analytically. They also discuss the validation of the models and suggest extensions to the models with emphasis on recognizing the strengths and limitations of each model. The highly recommended second edition was praised for its lucid writing and numerous real-world examples. With updated Maple™ and MATLAB® code as well as new case studies and exercises, this third edition continues to give students a clear, practical understanding of the development and interpretation of mathematical models.

Probability Theory and Mathematical Statistics 27 2019 The topics treated fall into three main groups, all of which deal with classical problems which originated in the work of Kolmogorov.
