combinations among them can develop different phenotypic characteristics. DNA methylation, histone modifications and small RNAs have been identified, and their functions are being studied in order to understand the mechanisms of interaction and regulation among the different biological processes in plants. Although, fundamental epigenetic mechanisms in crop plants are beginning to be elucidated, the comprehension of the different epigenetic mechanisms, by which plant gene regulation and phenotype are modified, is a major topic.

Lifelong Employability Aug 25 2019 Increased longevity means that current structures for employment and retirement in Switzerland are not sustainable. To enable individuals and companies to thrive in our ageing society, changes in our social norms and attitudes about work and ageing need to occur. Philippa Dengler examines what these changes are,

and what companies can do to support their employees to take control of their individual employability for a longer life. The practical implications benefit individuals, the companies they work for, and society as a whole.

comprehensive and self-contained introduction to the field, carefully balancing mathematical theory and practical applications. It starts at an elementary level, developing concepts of multivariate distributions from first principles.

After a chapter on the multivariate normal distribution reviewing the classical parametric theory, methods of estimation are explored using the plug-in principles as well as maximum likelihood. Two chapters on discrimination and classification,

including logistic regression, form the core of the book, followed by methods of testing hypotheses developed from heuristic principles, likelihood ratio tests and permutation tests.

Finally, the powerful self-consistency principle is used to introduce principal components as a method of approximation, rounded off by a chapter on finite mixture analysis.
