An Assessment Study of the Effect of Cost and Dose on the Hemodialysis Treatment in Colombia Feb 09 2021 Scope of Study: This dissertation investigates the effect of cost and dose on the hemodialysis treatment modality. This modality of dialysis is an alternative to renal transplantation for people diagnosed with end-stage renal disease. The mortality rate is used as a quality indicator of the hemodialysis treatment by assessing the quality of service in Colombia and comparing it with the quality of service in the United States. Findings and Conclusions: The hypothesis testing used in this research shows that there is a significant difference between the delivered dose of hemodialysis in Colombia and the United States. The mortality rate for patients in hemodialysis in Colombia for a comparable age group (45-64) is higher than that of the United States. This is attributed in great part to the effect of the hemodialysis dose on the treatment. A simple linear regression shows a strong negative relationship between mortality rate and dose. Cost also has an impact on the quality of service of the hemodialysis therapy. Nevertheless, a direct relationship between cost and mortality rate could not be established. Factors such as patient's vascular access and dialyzer flow rates are not evaluated in this investigation.

The Impact of a Renal Dosing Service on Dosage Adjustment in Ckd Apr 23 2022 Patients with chronic kidney disease (CKD) often have alterations in their pharmacokinetic and pharmacodynamic response. They constitute a population at high-risk for adverse drug reactions and drug-drug interactions. Drug dosing in these patients is a very challenging task. This book, therefore, implements a dosing service by a clinical pharmacist and evaluates its outcomes. It includes an introduction to CKD and the steps for suitable drugs' use and dosing, and then it includes methods, outcomes, discussion and conclusions related to the service. Part of the study was to utilize a collection of reliable and up-to-date references that are commonly used globally to develop a pocket size handbook for dosing recommendations related to renal impairment - if present- and removal by dialysis. These tables are available by the end of this book and they can be very useful to guide suitable dosing. This book can be useful for nephrologists, other physicians and pharmacists to help in providing the suitable dosages of medications according to patients' renal functions. It can be useful also for researchers and postgraduate students in this field.

This updated edition captures nearly 200 new drugs that have been approved by the FDA since the initial publication of *Renal Pharmacotherapy*. It also covers new evidence that has emerged regarding the need to adjust dosage of certain older medications that are eliminated by the kidneys.
