Radiation-induced Cancer from Low-dose Exposure Jun 19 2021 Reviewed in New England Journal of Medicine, February 14, 1991: "Strongly recommended ... excellent." This book provides proof that even at the lowest possible doses & dose-rates, exposure to ionizing radiation is carcinogenic, contrary to speculation that "repair" may provide a threshold. Additionally, in an open, checkable, step-by-step analysis from raw data to conclusion, Gofman shows that risk per dose-unit is much higher than the radiation community's 1990 estimates, & that ionizing radiation may be the most important single carcinogen to which vast numbers of humans are actually exposed -- medically, environmentally, occupationally. Gofman also includes chapters on Chernobyl-induced cancers, radio-iodine-induced thyroid cancer, latency & hormesis. Gofman is a Ph.D. nuclear chemist (1943), & a physician with an illustrious track-record of discovery, careful analysis, & correct forecasting in health research. His new findings in "Radiation-Induced Cancer" are essential input for policies toward cancer prevention, radioactive waste handling, nuclear power revival, "safe-dose" assumptions regarding radiation or other mutagens, conflict of interest in research, & the problem of retroactively altered databases. Reviewed in Choice, January

1991: "Thought-provoking...an important addition to the debate on the health effects of low-dose radiation."

Radiation Protection Aug 22 2021 This highly successful manual has served for nearly three decades as the definitive guide to the safe use of radioactive materials. Completely revised and updated, the fourth edition presents a new dimension by adding coverage of nonionizing radiation, and is thus concerned with the entire field of radiation protection. The author takes the novel approach of introducing the whole range of energies possessed by particles and electromagnetic waves at the beginning of the text, thus integrating coverage of ionizing and nonionizing radiation rather than considering them as two separate disciplines. He goes on to cover the entire spectrum of radiation sources, including radionuclides, x-ray machines, accelerators, nuclear reactors, power lines, microwave towers, and cellular phones. With its expanded coverage, including a broader focus on public health issues, this new volume will serve as an important training and reference resource, not only for research scientists, physicians, and engineers, but for regulatory officials, attorneys, engineers, and environmental health and safety professionals. The breadth of citations alone makes this resource invaluable.
