Variation in Datives Jul 17 2021 Variation in Datives collects new research  
on the nature of syntactic micro-variation in datives. The papers in this  
volume examine different aspects of internal variation in dative marking,  
such as agreement and case alternations, distribution of adpositional  
structures and dative case-marking, the different structural positions of  
dative arguments and their semantic contribution, and patterns of syncretism  
in the clitic and/or agreement system. Interest in these topics has grown  
significantly in the past 20 years. Variation in Datives makes a significant  
contribution to our understanding of language variation, as it adds the  
micro-comparative perspective to the general discussion and includes 10 new  
articles on a wide range of European languages, including Greek, Basque,  
Icelandic, and Serbo-Croatian. Variation in Datives will appeal to scholars  
and advanced students of syntax, linguistic variation, and especially  
syntactic micro-variation.

The Owner Builder Sep 18 2021 Building your own home could save you  
thousands of dollars. The Owner Builder is an easy-to-understand, step-by-

step guide for people who want to build their dream home in a financially responsible manner. From choosing a block of land to decorating the inside of the house, this book guides the reader through the entire building process. The authors share their personal experiences with photos of the building process in 68 steps. They include tips and hints on the approval process, construction ideas and how to avoid mistakes. They also uncover potential hidden costs, and offer other ways to save money if you don't have time to manage the construction yourself - such as hire a project manager, which is cheaper than a contract builder. Renovators, DIY enthusiasts and anyone considering building a home will find a wealth of practical information in this book. Even if you are hiring a builder, this book can help you understand what is involved in building a home and what to expect at each stage of the project.

*The Home Owner's Guide to HVAC* Dec 30 2019 How green is green? The average homeowner is usually well-informed about which products and concepts are considered "green," but they seem to have less of an understanding of how they compare, and which things work the best for the lowest investment. Did you know that 40 percent of the average home power bill is dedicated to air conditioning in warm climates? Further, energy is spent on cooking, hot water, clothes dryers, and such. Did you know that solar hydronic panels are way more efficient than solar voltaic panels? How about instantaneous water heaters? Are they good? Homeowners need to make dozens of decisions about which products or services they need in order to make their home the most efficient it can be for the given budget. Do you have mold or humidity problems? If you want to learn about things like the home envelope, HVAC, hot water, and electrical systems, this book is for you. It is written in plain English, and covers all the bases. Also, given are tips on saving the environment from an engineer's perspective. The author is a big fan of the environment, but does not like "greenwashing." The generic definition of greenwashing is the practice of making an unsubstantiated or misleading claim about the environmental benefits of a product, service, or technology. Pros and cons of various "green" products are discussed so that the homeowner can understand the smartest purchases and practices. One of the things you will learn is that the envelope of the home is just as important as the HVAC. You have to understand both to be successful. The envelope is thoroughly discussed as well as HVAC, plumbing, electrical, and the various green technologies.

*Solar Israel a practical and legislative model May 15 2021 In Israel, solar is an everyday reality for 80% of the population. Since 1980 every new building has been required by law to have a solar installation. Using solar heating for household hot water alone saves over 5% on the country's*

electricity consumption - a precious contribution in a country that fully relies on imported fuel and coal for its energy. Israel's example provides a powerful demonstration of what can be achieved if governments make a commitment to solar energy. It is a common opinion that solar energy utilization is not yet economical, that it is one of the options for the future, still at the research and development stage. In Israel, however, solar energy is not just an interesting technology for the future. It is an everyday reality, with 80% of the whole population using solar installations for water heating in their homes - saving more than 5% of the national electricity consumption. Solar energy is one of the main subjects of the governmental budget for energy research and development, and it seems set to continue to invest in solar energy in the future. When we look at the landscape of Israeli cities, we can see the endless number of solar installations, which is very typical for Israel. The current optimal design of the typical Israeli solar water heater combines 30 years' experience and governmental involvement. The installation of solar water heaters in Israel is required by law. Since 1980 every new building must be equipped with solar water heater. The law describes exactly the size of the installation for the various sectors, ensures the quality of the solar equipment and installations and provides the rules for installing solar water heaters in existing multi-apartment buildings. Many countries could achieve similar success in a very short time. To promote solar energy, governments should act to overcome barriers and stimulate market forces, through research and development, large scale demonstration, information and legislation. The first step, however, is for a government's commitment to solar energy.

Energy Efficiency in Domestic Appliances and Lighting Jul 05 2020 This book contains peer-reviewed papers presented at the 10th International Conference on Energy Efficiency in Domestic Appliances and Lighting (EEDAL'19), held in Jinan, China from 6-8 November 2019. Energy efficiency helps to mitigate CO2 emissions and at the same time increases the security of energy supply. Energy efficiency is recognized as the cleanest, quickest and cheapest energy source. Not only this, but energy efficiency brings several additional benefits for society and end-users, such as lower energy costs, reduced local pollution, better outdoor and indoor air quality, etc. However, in some sectors, such as the residential sector, barriers to investments in energy efficiency remain. Legislation adopted in several jurisdictions (EU, Japan, USA, China, India, Australia, Brazil, etc.) helps in removing barriers and fosters investments in energy efficiency. These initiatives complement innovative financing schemes for energy efficiency, the provision of energy services by energy service companies and different types of information programs. At the same time, progress in appliance technologies and in solid state lighting offer high levels of efficiency. LED lighting is an example. As with previous conferences in this series, EEDAL19 provided a unique forum to discuss and debate the latest developments in energy and environmental impact of households, including appliances, lighting, heating and cooling equipment, electronics, smart meters, consumer behavior, and policies and programs. EEDAL addressed non-technical issues such as consumer behavior, energy access in developing countries, and demand response.
