inorganic chemistry, solid state chemistry, materials chemistry, and nanoscience. The work is designed to follow on, with a different viewpoint and format, from our 1973 work, *Comprehensive Inorganic Chemistry*, edited by Bailar, Emeléus, Nyholm, and Trotman-Dickenson, which has received over 2,000 citations. The new work will also complement other recent Elsevier works in this area, *Comprehensive Coordination Chemistry* and *Comprehensive Organometallic Chemistry*, to form a trio of works covering the whole of modern inorganic chemistry. Chapters are designed to provide a valuable, long-standing scientific resource for both advanced students new to an area and researchers who need further background or answers to a particular problem on the elements, their compounds, or applications. Chapters are written by teams of leading experts, under the guidance of the Volume Editors and the Editors-in-Chief. The articles are written at a level that allows undergraduate students to understand the material, while providing active researchers with a ready reference resource for information in the field. The chapters will not provide basic data on the elements, which is available from many sources (and the original work), but instead concentrate on applications of the elements and their compounds. Provides a comprehensive review which serves to put many advances in perspective and allows the reader to make connections to related fields, such as: biological inorganic chemistry, materials chemistry, solid state chemistry and nanoscience. Inorganic chemistry is rapidly developing, which brings about the need for a reference resource such as this that summarise recent developments and simultaneously provide background information. Forms the new definitive source for researchers interested in elements and their applications; completely replacing the highly cited first edition, which published in 1973.

replace lecture material or conventional textbooks, but rather to enhance the course by challenging the student to test his or her knowledge. Indeed, the introduction emphasizes that students should read their lecture notes and textbook before tackling the self-learning text. The self-learning text concentrates on reactions and mechanisms with emphasis on rationalizing reactions rather than memorizing them. The text assumes knowledge covered in Patrick's Beginning Organic Chemistry. In each section of the book, the student is led through the subject matter by being given a short piece of theory, followed by a question. A space is then provided for the student's answer and then the full model answer is given. The next bit of theory follows and so on. In this way, students are encouraged to think about what they are reading at all times, rather than getting information 'gift wrapped'. Each section finishes with a summary of the most important facts.
