**The Reign of Constantine, 306-337** Jul 18 2019 This book explores the reign of Constantine the Great (306-337) and, more generally, the political history of the third century, thus putting Constantine's career and many of his decisions in context. It traces events under the first Tetrarchy and then explores Constantine's rise to power, his rule and reforms, and continuity and change with regard to his predecessors. It considers how he was able to transform the empire and establish his own dynasty, highlighting his political and military prowess, and therefore provides an essential overview of the political history of the period. Stanislav Doležal is Assistant Professor at the University of South Bohemia, Czech Republic.

[The Korean Automotive Industry, Volume 1](#) Jan 04 2021 In 1962, South Korea assembled just 1,100 new automobiles. By 1996, this total had soared to 2,812,714. What explains this remarkable growth? The answer is complex, and involves a combination of a supportive State, timely technology alliances, a skilled but historically low-paid workforce, aggressive pricing, savvy entrepreneurs, and fortuitous circumstances. Despite this amazing ascent, comparatively little has been written about the Korean auto industry in English. In the first of a two-volume set, this 11-chapter book seeks to help fill this void by providing in-depth examinations of all six of Korea's automakers from their beginnings through 1996. Uniquely written from the perspective of industry analysts at the time (without knowledge of the Asian Fiscal Crisis), the book should prove informative to practitioners, scholars, and students interested in automotive history, international political economy, Asian studies, and more. A.J. Jacobs is Professor of Sociology at East Carolina University, USA.

**The Vitreous State** Mar 06 2021 This book summarizes the experimental evidence and modern classical and theoretical approaches in understanding the vitreous state, from structural problems, over equilibrium and non-equilibrium thermodynamics, to statistical physics. Glasses, and especially silicate glasses, are only the best known representatives of this particular physical state of matter. Other typical representatives include organic polymer glasses, and many other easily vitrifying organic and inorganic substances, technically important materials, amidst them vitreous water and vitrified aqueous solutions, and also many metallic alloy systems. Some of these systems only form glasses under particular conditions, e.g. through ultra-rapid cooling. This book describes the properties and the formation of both every-day technical glasses and especially of such more exotic forms of vitreous matter. It is a unique source of knowledge and new ideas for materials scientists, engineers and researchers working on condensed matter. The new edition emphasizes latest experimental findings and modern theories, explaining the kinetics of glass formation, the relaxation and stabilization of glasses and their crystallization in terms of new models, derived from the framework of the thermodynamics of irreversible processes. It shows how the properties of common technical glasses, window glass, or the vitreous ice kernel of comets can be used to develop a new understanding of the existence of matter in various, unusual forms. The described theories can even find application for the description of lasers and interesting unusual processes in the universe.

*Elliptic Equations in Polyhedral Domains* Jun 09 2021 This is the first monograph which systematically treats elliptic boundary value problems in domains of polyhedral type. The authors mainly describe their own recent results focusing on the Dirichlet problem for linear strongly elliptic systems of arbitrary order, Neumann and mixed boundary value problems for second order systems, and on boundary value problems for the stationary Stokes and Navier-Stokes systems. A feature of the book is the systematic use of Green's matrices. Using estimates for the elements of these matrices, the authors obtain solvability and regularity theorems for the solutions in weighted and non-weighted Sobolev and Holder spaces. Some classical problems of mathematical physics (Laplace and biharmonic equations, Lamé system) are considered as examples. Furthermore, the book contains maximum modulus estimates for the solutions and their derivatives. The exposition is self-contained, and an introductory chapter provides background material on the theory of elliptic boundary value problems in domains with smooth boundaries and in domains with conical points. The book is destined for graduate students and researchers working in elliptic partial differential equations and applications.

[Organometallic Syntheses](#) Jan 16 2022 Over 160 detailed and tested procedures for the preparation of specific organometallic compounds are given in Volume 4. Part I contains procedures for the synthesis of 76 types of transition metal organometallic compounds, and Part II procedures for the synthesis of 85 nontransition metal organometallic compounds. In both parts, the editors have sought to include procedures that give the safe, reliable synthesis of organometallic compounds that can lay some claim to significance in current chemical research. This significance may be based on various factors such as: (a) the synthesis describes the formation of an unusual or less common structural type; (b) the compound prepared is a useful intermediate in other syntheses; (c) the compound is a model reagent for investigating the mechanisms of various fundamental or industrial processes, such as the Fischer-Tropsch reaction; (d) the compound is a useful reagent in organic synthesis; and (e) the techniques employed in the synthesis of the compound are unusual and worthy of further application, such as metal-atom and electrochemical procedures. Each specific or generalized procedure is organized into the following sections: an Introduction which discusses the available procedures and the reasons guiding the choice of the one selected; a Procedure section which strives to describe the modus operandi, the safety concerns and pitfalls in the preparation; a Properties section that offers further physical and chemical data on the product and, where appropriate, indications of how the compounds can be employed in research; and a Reference section which gives both leading literature citations and supplemental comments on the procedure. Research laboratories in organometallic chemistry, organic chemistry, inorganic chemistry and molecular catalysis have in this book a rich source of information on the preparation of organometallic compounds.
