*MATLAB® and Design Recipes for Earth Sciences* Mar 03 2020 The overall aim of the book is to introduce students to the typical course followed by a data analysis project in earth sciences. A project usually involves searching relevant literature, reviewing and ranking published books and journal articles, extracting relevant information from the literature in the form of text, data, or graphs, searching and processing the relevant original data using MATLAB, and compiling and presenting the results as posters, abstracts, and oral presentations using graphics design software. The text of this book includes numerous examples on the use of internet resources, on the visualization of data with MATLAB, and on preparing scientific presentations. As with its sister book *MATLAB Recipes for Earth Sciences-3rd Edition (2010)*, which demonstrates the use of statistical and numerical methods on earth science data, this book uses state-of-the art software packages, including MATLAB and the Adobe Creative Suite, to process and present geoscientific information collected during the course of an earth science project. The book's supplementary electronic material (available online through the publisher's website) includes color versions of all figures, recipes with all the MATLAB commands featured in the book, the example data, exported MATLAB graphics, and screenshots of the most important steps involved in processing the graphics.

The book starts from the very beginning, so when you are new to photo editing, that's no problem! The book starts with installing and configuring GIMP 2.10 to make it look and act as Photoshop. Then all aspects of photo editing are covered, and no stone will be left unturned! Everything will be shown in easy to follow steps. You will learn how to improve and correct photographs professionally, and how to work with layers. You'll learn how to crop images, how to resize images, how to

You will learn professional retouching, like skin retouching with frequency separation, Liquify (for example to make someone thinner), how to let the program remove objects, and how to remove objects with the clone and heal tool. You will learn how to use masks, and how to make selections. In Chapter 5 we will go in to making professional selections with just a single click (this is not possible in Photoshop!) using the patented 'U-point technology'. The U-point technology is delivered by the Google Nik Collection, a professional high-end photo editing "plug-in" suite, used by professional photographers. The Google Nik Collection and its integration into GIMP will be discussed in its whole. So in addition to gaining great expertise in GIMP, this book will also cover the complete Google Nik Collection. We'll download and install the software, together with a special plugin that will let you work with the Google Nik Collection from out of GIMP. You will learn how to create black and white images at a professional level with the most powerful black and white plugin on the market, and you will learn how to sharpen images and remove noise. We'll look at making vignettes, and HDR photography. We'll look at the use of text, kerning text, and how to make eye-catching book covers. You'll learn everything about all the powerful blending modes, and the practical use of each blending mode will be shown and explained. You'll learn how to select hair, how to use and make patterns and gradients, and how to use and adjust a tablet. You will learn everything about brushes. How to create brushes yourself, the many special effects you can create with brushes (e.g. to create a flock of birds with just a single stroke, or to create grunge textures), and how to download free creative brushes. We will look at a popular skin retouching technique used by professionals called "frequency separation", and different methods for dodging and burning (selectively darkening and lightening of an image). We will discuss color theory, and it's direct connection to the ways color is manipulated in photo manipulation programs. We'll discover creative filters that bring a different look and feel to your image. The book is created for the Windows (7,8,10) user. With some extra steps however, the Linux user

can also follow along. The book has been printed in black and white to keep the price as low as possible. About the writer: Bernard 't Hooft has over 15 years of experience with professional photo editing, and teaches photo editing at the VolksUniversiteit in the Netherlands.

*Perl Graphics Programming* Sep 08 2020 Graphics programmers aren't the only ones who need to be proficient with graphics. Web and applications programmers know that a dull web page can be quickly transformed into one that's interesting and lively with the use of well-planned graphics. And fortunately, you don't need the skills of a fulltime graphics programmer to use graphics effectively. From access counters and log report graphs to scientific plots and on-the-fly animated GIFs, graphics scripting is within the grasp of most web programmers. Using open source software, like Perl, you have the power to dynamically generate graphics based on user input and activity, easily manipulate graphics content, and optimize graphics for compression and quality. Geared toward Perl users and webmasters, Perl Graphics Programming focuses on open-source scripting programs that manipulate graphics files for use on the Web. The book demystifies the manipulation of graphics formats for newcomers to the Web with a practical, resource-like approach. With this book you'll learn to: Generate dynamic web graphics with charts, tables, and buttons Automate graphics tasks (thumbnails and borders) Create dynamics web documents (PDF, Postscript) Produce rich Internet experiences with Flash and SVG You'll begin with a tour of the most common web graphic file formats--PNG, JPEG, GIF, SWF, SVG, Postscript and PDF--then you'll explore the most powerful tools and Perl modules available for manipulating these graphics, such as GD, PerlMagick, and GIMP. Included in this part of the book is a thorough description of the Ming module for creating on-the-fly Flash files. Next, a "cookbook" section includes practical, all purpose recipes: GIF animation, generating images

within a dynamic application, communicating between SWF front-end and Perl back-end, XSLT transformations, compression, and much more. Perl programmers naturally turn to Perl to tackle whatever challenge they have at hand, and graphics programming is no exception. Perl Graphics Programming provides all the tools you need to begin programming and designing graphics for the Web immediately. This book will change how you think about generating and manipulating graphics for the Web.
