**Crossing the Quality Chasm** Feb 26 2020 Second in a series of publications from the Institute of Medicine's Quality of Health Care in America project Today's health care providers have more research findings and more technology available to them than ever before. Yet recent reports have raised serious doubts about the quality of health care in America. Crossing the Quality Chasm makes an urgent call for fundamental change to close the quality gap. This book recommends a sweeping redesign of the American health care system and provides overarching principles for specific direction for policymakers, health care leaders, clinicians, regulators, purchasers, and others. In this comprehensive volume the committee offers: A set of performance expectations for the 21st century health care system. A set of 10 new rules to guide patient-clinician relationships. A suggested organizing framework to better align the incentives inherent in payment and accountability with improvements in quality. Key steps to promote evidence-based practice and strengthen clinical information systems. Analyzing health care organizations as complex systems, Crossing the Quality Chasm also documents the causes of the quality gap, identifies current practices that impede quality care, and explores how systems approaches can be used to implement change.

*To Err Is Human* Dec 06 2020 Experts estimate that as many as 98,000 people die in any given year from medical errors that occur in hospitals. That's more than die from motor vehicle accidents, breast cancer, or AIDS—three causes that receive far more public attention. Indeed, more people die annually from medication errors than from workplace injuries. Add the financial cost to the human tragedy, and medical error easily rises to the top ranks of urgent, widespread public problems. *To Err Is Human* breaks the silence that has surrounded medical errors and their consequence—but not by pointing fingers at caring health care professionals who make honest mistakes. After all, to err is human. Instead, this book sets forth a national agenda—with state and local implications—for reducing medical errors and improving patient safety through the design of a safer health system. This volume reveals the often startling statistics of medical error and the disparity between the incidence of error and public perception of it, given many patients' expectations that the medical profession always performs perfectly. A careful examination is made of how the surrounding forces of legislation, regulation, and market activity influence the quality of care provided by health care organizations and then looks at their handling of medical mistakes. Using a detailed case study, the book reviews the current understanding of why these mistakes happen. A key theme is that legitimate liability concerns discourage reporting of errors—which begs the question, "How can we learn from our mistakes?" Balancing regulatory versus market-based initiatives and public versus private efforts, the Institute of Medicine presents wide-ranging recommendations for improving patient safety, in the areas of leadership, improved data collection and analysis, and development of effective systems at the level of direct patient care. *To Err Is Human* asserts that the problem is not bad people in health care—it is that good people are working in bad systems that need to be made safer. Comprehensive and straightforward, this book offers a clear prescription for raising the level of patient safety in American health care. It also explains how patients themselves can influence the quality of care that they receive once they check into the hospital. This book will be vitally important to federal, state, and local health policy makers and regulators, health professional licensing

officials, hospital administrators, medical educators and students, health caregivers, health journalists, patient advocates"as well as patients themselves. First in a series of publications from the Quality of Health Care in America, a project initiated by the Institute of Medicine

Patient Handling Safety for Nursing Staff Jun 24 2022 The effectiveness of video scoring and feedback about the scoring of the components of safe patient transfers was observed among eight nursing staff members in a skilled nursing department within an acute care hospital. An ABCA (and sometimes ABCDA), multiple baseline across individuals design was utilized in the study. The dependent variable under investigation was the percentage of safe lifting components. Following baseline measures, nursing staff participated in an information phase during which they reviewed and discussed components of safe patient transfers. A video scoring phase was introduced, during which, participants viewed and scored a model video of a patient transfer. Video scoring was not as effective in improving the safety of patient transfers for two of the participants during the video scoring phase as it had been for the other participants and a feedback phase was added for these two participants. Finally, a withdrawal phase was implemented for six participants to determine the long-term effects of the study. The current study suggests that video scoring and feedback are effective in increasing the safe behaviors related to patient transfers and reducing the possibility of back injuries among health care workers in a skilled nursing facility.

**Fundamental Nursing Skills** Dec 18 2021 Providing forward-thinking approaches and ideas for nurses of all categories, this reference has been written primarily in response to increasing concerns regarding the perceived lack of ability in both students and newly qualified nurses to perform clinical skills. By outlining the elements of essential nursing procedure in a readily accessible format, including rationale for recommended actions and promoting evidence-based practice, this text encourages the reader to keep a record of achievement in relation to clinical skill competence. The selection of skills included is based on extensive consultation with experienced clinicians, students, clients and teachers of nursing. Each procedure has been carefully researched to provide a contemporary foundation for practice. The text also contains a rapid reference section of common terminology, conversion tables, laboratory results and other useful information.

**Nursing Skills for Children and Young People's Mental Health** Dec 26 2019 This book focuses on those nursing skills that are truly valued and needed by children and young people with mental health problems. Whilst other books have chiefly focused on mental health conditions and treatments, this book moves away from this formulaic approach and considers what children and youth themselves need most from health professionals. It shows why nursing skills are among the most precious values for patients. This focus on therapeutic relationships, establishing trust-based forms of nursing, and empowering children and young people to develop into healthy and resilient young adults has largely been neglected,

despite the feedback from those who urgently need help but often struggle to find it, or are wary of seeking help and reluctant to engage. This book focuses on the places where nurses encounter young people and seek to help them. It examines the role nurses play in specialist child and adolescent mental health settings (such as in-patient and community, as psychotherapists, and on self-harm teams) and where paediatric nurses work with troubled young people (in emergency departments, paediatric wards and primary care). It also considers two specific areas, namely eating disorder services and consent-seeking, that could benefit from nursing skills that are currently undervalued, but are in fact invaluable. Its focus on those skills that nurses already have, but may not be consciously using, will make this book uniquely appealing to all nurses who work with children and young people with mental health problems, regardless of the setting, and an essential guide for students and experienced professionals alike.

Handling the Sick Jun 19 2019 "Handling the Sick is the story of 838 women who entered St. Luke's Hospital Training School for Nurses, St. Paul, Minnesota, from 1892-1937. Their story addresses a fundamental question about nursing that has yet to be answered: is nursing a craft or a profession? It also addresses the colliding visions of nursing factions that for more than a century have disagreed on the inherent traits and formal preparation a nurse has needed." "The women of St. Luke's were engaged in the most practical of all occupations open to women, a rare one in which their strength, experience, and skill were prized above all else. They firmly believed that the key to success in nursing was apprenticeship training. Apprenticeship, not schooling, was the cornerstone on which all else rested." "This study unites the opposing visions of those who led nursing toward professional status and those who saw it as a craft. Physicality, strength of will, an abiding emphasis on practicality, and a hierarchy based on a deep pride in craft skills have been essential elements of nursing. Nursing can look to its complex history to develop an integrated model of nursing, one drawing on both academic training and the immediate realities involved in "handling the sick."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. Nursing Staff in Hospitals and Nursing Homes Jan 07 2021 Hospitals and nursing homes are responding to changes in the health care system by modifying staffing levels and the mix of nursing personnel. But do these changes endanger the quality of patient care? Do nursing staff suffer increased rates of injury, illness, or stress because of changing workplace demands? These questions are addressed in *Nursing Staff in Hospitals and Nursing Homes*, a thorough and authoritative look at today's health care system that also takes a long-term view of staffing needs for nursing as the nation moves into the next century. The committee draws fundamental conclusions about the evolving role of nurses in hospitals and nursing homes and presents recommendations about staffing decisions, nursing training, measurement of quality, reimbursement, and other areas. The volume also discusses work-related injuries, violence toward and abuse of nursing staffs, and stress among nursing personnel--and examines whether these problems are related to staffing levels. Included is a readable overview of the underlying trends in health care that have given rise to urgent questions about nurse staffing: population changes, budget pressures, and the introduction of new technologies. *Nursing Staff in Hospitals and Nursing Homes* provides a straightforward examination of complex and sensitive issues surround the role and value of nursing on our health care system.

*Investigating the Effectiveness of Posture Coaching and Feedback During Patient Handling Activities in a Student Nursing Population* Jul 13 2021 The daily routine of nurses and other caregivers is physically demanding and in turn, the profession is at a high risk of developing musculoskeletal injuries and/or disorders (MSDs). This thesis has two sections. The purpose of the first section (the pilot study) was to perform a preliminary biomechanical analysis of trunk kinematics and muscle activity during common patient handling activities to aid in the determination of coaching for a follow up feedback study. The second section determined the effects of a feedback intervention (combined verbal and auditory) on trunk kinematics during simulated patient handling tasks in a student nursing population. Nine student nurses participated. Participants performed three commonly used patient-handling tasks before, during and after an intervention session. The largest reductions in trunk angle, acceleration and velocity were found in the most complex transfer, bed-to-chair. The feedback session improved peak kinematics, and this could suggest that the feedback intervention may help reduce the risk of low back pain associated with patient handling. There is a continuing need to ensure that caregivers are properly trained to protect themselves and their patients during patient handling tasks when assistive devices are not available such as in transferring a patient from the bed to the wheelchair.
