[International Conference on Ignition Systems for Gasoline Engines – International Conference on Knocking in Gasoline Engines](#) 15-20 2022 For decades, scientists and engineers have been working to increase the efficiency of internal combustion engines. For spark-ignition engines, two questions in particular are always in focus: 1. How can the air/fuel mixture be optimally ignited under all possible conditions? 2. How can unburnt but recurrent early and self-ignitions in the air/fuel mixture be avoided? Against the background of the considerable efficiency increases currently sought in the context of developments and the introduction of new fuels, such as hydrogen, methanol, ammonia and other hydrogen derivatives as biofuels, these questions are more in the focus than ever. In order to provide a perfect exchange platform for the community of combustion and system developers from research and development, IAV has organized this combined conference, chaired by Marc Sens. The proceedings here represent the collection of all the topics presented at the event and are thus intended to serve as an inspiration and pool of ideas for all parties.

Proceedings of the 4th International Congress of Automotive and Transport Engineering (ATA 2018) (ATA 2018) This volume includes selected and reviewed papers from the 4th International Congress of Automotive and Transport Engineering, held in Cluj, Romania, in September 2018. Authors are experts from research, industry and universities coming from 14 countries worldwide. The papers are covering the latest developments in automotive vehicles and environment, advanced transport systems and road traffic, heavy and special vehicles, new materials, manufacturing technologies, logistics, accident research and analysis and innovative solutions for automotive vehicles. The conference is organized by SIAR (Society of Automotive Engineers from Romania) in cooperation with FISITA.

[Liquid Piston Engines](#) Jan 31 2020 Whether used in irrigation, cooling nuclear reactors, pumping wastewater, or any number of other uses, the liquid piston engine is a much more efficient, effective, and "greener" choice than many other choices available to industry. Especially if being used in conjunction with solar panels, the liquid piston engine can be extremely cost-effective and has very few, if any, downsides or unwanted side effects. As industries all over the world become more environmentally conscious, the liquid piston engine will continue growing in popularity as a better alternative. Its low implementation and operational costs will be attractive to end-users in developing countries. This is the only comprehensive, up-to-date book available on liquid piston engines. The first part focuses on the identification, design, construction and testing of the liquid piston engine, a simple, elegant, device which has the ability to pump water but which can be manufactured easily without any special tooling or exotic materials and

be powered from either combustion of organic matter or directly from solar heating. It has been tested, and the authors recommend how it improved upon. The underlying theory of the device is also presented and discussed. The second part deals with the performance, troubleshooting, maintenance of the engine. This volume is the only one of its kind, a groundbreaking examination of a fascinating and environmentally friendly technology which is useful in many industrial applications. It is a must-have for any engineer, manager, or technician working with pumps or
