A Decade of the Berkeley Math Circle Oct 23 2019 Many mathematicians have been drawn to mathematics through their experience with math circles. The Berkeley Math Circle (BMC) started in 1998 as one of the very first math circles in the U.S. Over the last decade, half, 100 instructors--university professors, business tycoons, high school teachers, and more--have shared their passion for mathematics by delivering over 800 BMC sessions on the UC Berkeley campus every week during the school year. This second volume of the series is based on a dozen of these sessions, encompassing a variety of enticing and stimulating mathematical topics, some new and some continuing from Volume I: from dismantling Rubik's Cube and randomly putting it back together to solving it with the power of group theory; from raising knot-eating machines and letting Alexander the Great cut the Gordian Knot to breaking through knot theory with the Jones polynomial; from entering a seemingly hopeless infinite raffle to becoming friendly with multiplicative functions in the language of Dirichlet, Möbius, and Euler; from leading an army of jumping fleas in an old problem from the International Mathematical Olympiad to improving our own essay-writing strategies; from searching for optimal paths on a hot summer day to questioning whether a path exists on his way to discovering trigonometry 2000 years ago Do some of these scenarios sound bizarre, having never before been associated with mathematics? Mathematicians love having fun while doing serious mathematics and that love is what this book intends to share with the reader. Whether at a beginner, an intermediate, or an advanced level, anyone can find a place here to be provoked to think, to be inspired to create. In the interest of fostering a greater awareness and appreciation of mathematics and its connections to other disciplines and everyday life, MSRI and the AMS are publishing books in the Mathematical Circles Library series as a service to the public, their parents and teachers, and the mathematics profession. Titles in this series are co-published with the Mathematical Research Institute (MSRI).

Questions and answers are organized into five areas of effort that will help you most thrive in your elementary math classroom: 1. How do I build a positive math classroom? 2. How do I structure, organize, and manage my math class? 3. How do I engage my students in math? 4. How do I help my students learn about math? 5. How do I know what my students know and move them forward? Woven throughout, you'll find helpful sidebars on fostering identity and agency; access and equity; teaching in different settings; and invaluable resources for deeper learning. Math Exchanges | Date: 03/20/2020
Traditionally, small-group math instruction has been used as a format for reaching children who struggle to understand. Math coach Kassia Omohundro Wedekind uses small-group instruction as the centerpiece of her math workshop, engaging all students in rigorous "math exchanges." The key characteristics of these mathematical conversations are that they are 1) short, focused sessions that bring all mathematical minds together, 2) responsive to the needs of the specific group of math learners, 3) designed for meaningful, guided reflection. As in reading and writing workshop, students in math workshop become self-directed and independent while participating in a classroom community of learners. Through the math exchanges, students focus on number sense, the big ideas of mathematics. Teachers guide the conversations with small groups of students, mediating talk and thinking about problem-solving strategies, discuss how math works, and move toward more effective and efficient approaches and greater mathematical understanding. Although grounded in theory and research, *Math Exchanges: Guiding Young Mathematicians in Small Group Math* is written for practicing teachers and answers such questions as the following: How can I use a math workshop approach and not a certain textbook or set of standards? How should I form small groups? How often should I meet with small groups? What should I do in small groups? How can I tell if my groups are making progress? What do small-group math exchanges look like, sound like, and feel like?
