Reflections on Programming Systems Aug 21 2021 This book presents a historical and philosophical analysis of programming systems, intended as large computational systems like, for instance, operating systems, programmed to control processes. The introduction to the volume emphasizes the contemporary need for a foundational analysis of such systems, rooted in a broader historical and philosophical discussion. The chapters are grouped around three major themes. The first concerns the early history of large systems against the background of issues related to the growing semantic gap between hardware and code. The second revisits the fundamental issue of complexity of large systems, dealt with by the use of formal methods in the development of 'grand designs' like Unix. Finally, a third part considers several issues related to programming systems in the real world, including chapters on aesthetical, ethical and political issues. This book will appeal to researchers from a diversity of backgrounds. It will appeal to historians, philosophers, as well as logical computer scientists who want to engage with topics relevant to the history and philosophy of programming, more specifically the role of programming systems in the foundations of computing.

Design Manual for High Temperature Hot Water and Steam Systems Feb 12 2021 A technical engineering manual presenting a hands-on approach for solving problems related to the design and analysis of both low and high temperature hot water and steam energy systems. This convenient single-volume source demonstrates time-saving calculations for sizing and selecting energy system requirements, including types of fuel, storage and handling facilities, waste disposal needs, HVAC needs, and back-up systems. Also discusses calculation methods for sizing compressors, air pollution equipment, fans, filters and related components. Takes into account special considerations for fuel corrosion, and chemical variation in the water and air.

Integrated Hypersonic Aerothermoelastic Methodology for Transatmospheric Vehicle (TAV)/thermal Protection System (TPS) Structural Design and Optimization Apr 10 2020 The adaptation of ZONA unified hypersonic/supersonic method ZONA7U and its integration/development into a ZONA aerothermoelastic system for transatmospheric vehicle (TAV)/thermal protection system (TPS) design/analysis was proved to be a successful tool through feasibility study with cases of a CKEM body, blunt cones, and a modeled X-34

Preceding the feasibility study, substantial effort was directed toward further development of a new ZSTREAM, and using it and ZABRO to replace the outdated modules in SHVD, thus to couple them with for aerothermoelastic applications. In the feasibility study, the cases are well validated with FD solution computed heat rates by applying ZONA aerothermoelastic software to X-34 through two assigned hyp trajectories were shown and found to agree with those using MINIVER. A potential TPS design procedure established using the obtained heat rates as an input to MINIVER, resulting in a minimum weight TPS wall consideration. With FEM/TRIM modules, ASTROS\* yields the trim solution and stress distribution for flexible X-34 at a typical trajectory joint, demonstrating the multifunctionality in MDO for the aerothermo software.

Investigation of Numerical Techniques for Predicting Aerodynamic Heating to Flight Feb 24 2023 The development of complex lifting configurations and high speed maneuvering vehicles has emphasized the use of numerical techniques to predict aerodynamic heating rates as a function of the vehicle trajectory. The use of numerical programs are not expected to eliminate the requirements for wind tunnel and flight testing.

an aid to more efficient use of experimentation time and improve confidence that all potential problems of the vehicle have been examined. Three programs, the Hypersonic Arbitrary Body Program, the MINIVER Program, and a third program were examined to determine their usefulness for vehicles with non-circular cross sections and large flat areas as exemplified by lifting reentry vehicles. The MINIVER code was found to be unsuitable for this; the Hypersonic Arbitrary Body Program was applicable to these shapes, but because of program limitations was used for only limited calculations. The last program also had limitations in the geometry description and surface pressure calculations. Efforts were made to remove these limitations and several shapes were investigated. The ultimate goal of this effort was to extend the capabilities of the existing heating codes; while no effort was made to improve MINIVER or the Hypersonic Arbitrary Body Program, significant improvements were made in the last program and inviscid flow field program.
